Executive Summary

The *Cumberland Traffic Circulation and Signing Study* summarizes a review of existing truck, vehicular, and pedestrian traffic in the City of Cumberland in Allegany County, Maryland. The study examines particular areas in the City where operational, safety, and signing deficiencies were identified, and provides improvement strategies to address these deficiencies. To accomplish the primary study goals, truck-related movements, concerns, constraints, and opportunities were analyzed from a system-wide perspective.

Background Data and Analysis

Project data includes a compilation and analysis of current truck and passenger vehicle traffic volume and accident data available from the City and State Highway Administration. An inventory and assessment of existing signage and street and intersection design and geometrics (including vehicle weight constraints) for all collector and arterial streets was conducted to identify signage and structural deficiencies. Vehicular and pedestrian traffic counts were conducted at specific areas of concern.

Issues of Concern

In response to the issues and concerns that were identified, potential improvement options were developed and refined based on stakeholder discussions and a review of the specific conditions within the City of Cumberland. Improvement options were investigated as follows:

- Signing and Marking Improvements
- Signalization Improvements
- Geometric Improvements

Project Action Plan

Improvement options were developed based on a variety of analysis tools. The most effective and feasible options were selected and summarized in the Project Action Plan below.

Issue #	Location	Description
<i>Signing and Marking Improvements</i>		
B	Citywide	Begin phased program of modernizing street name signs; begin discussion with SHA about developing a coordinated tourism signing program;
C.2	Mechanic Street at Queen City Drive (north side)	Install signs along Mechanic Street restricting all trucks over ¾ ton, except local deliveries, beyond Queen City Drive; repaint the southbound Mechanic Street approach to remove the separate left-turn lane; relocate the westbound lane of Queen City Drive to the north.
D.2	Baltimore Street at Canal Street	Consult with local business owners about restricting westbound left turns and requiring drivers to access Canal Street from the south, which would require installation of signs showing the left turn restriction.
C.3/D.3	Baltimore Street/Washington Street at Cumberland Street/Greene Street	As a short term solution, install skipped double yellow striping at the intersection between the Baltimore Street and Greene Street approaches and install a STOP sign along the Greene Street approach with a sign stating "EXCEPT RIGHT TURN". To discourage trucks from driving on Washington Street, add the regulatory message "NO TRUCKS" below the guide message on westbound Baltimore Street and install a standard I-68 sign assembly on the same approach.
D.7	McMullen Bridge	Install signing along Henderson Avenue, Polk Street, Columbia Avenue, and Independence Avenue to direct traffic onto the bridge.
<i>Signalization Improvements</i>		
A	Citywide	Conduct detailed study of the cost of modernizing and retiming traffic signals Citywide. Acquire funding for phased implementation of the modernization plan.

Issue #	Location	Description
D.1	Baltimore Street at Mechanic Street	Remove the pedestrian phase and allow pedestrians to cross the roadway during vehicular phases; investigate coordination of this signal with the nearby signals at the intersections of Mechanic Street at Bedford Street and Mechanic Street at Harrison Street.
D.4	MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps	As a short term solution, implement the proposed signal timing revisions.
<i>Geometric Improvements</i>		
D.3	Baltimore Street/Washington Street at Cumberland Street/Greene Street	As a long term solution, examine the feasibility of a roundabout.
D.4	MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps	As a long term solution, implement Alternative 2, which includes changes to the northbound lane configurations, as well as signalization of the Eastbound I-68 off-ramp. Install new overhead signs to direct traffic into the correct lane.
D.5	MD 51 at Lamont Street	Restrict thru and left turns from Lamont Street, and restrict left turns from southbound MD 51. Install signing directing southbound vehicles to make a u-turn at 2 nd Street and then turn right onto Lamont Street.
D.6	MD 51 at Virginia Avenue	Install either of the Michigan Left proposals.
<i>Improvements from Related Issues</i>		
D.2	Baltimore Street at Canal Street	The signal timing improvements at the nearby intersection of Baltimore Street at Mechanic Street will improve operations at this intersection.
E.1	MD 51 NB at Canal Parkway NB Weave	Implementation of the solutions at the intersection of MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps will improve operations in this area.

Issue #	Location	Description
<i>Geometric Improvements</i>		
5	Baltimore Street/Washington Street at Cumberland Street/Greene Street	As a long term solution, examine the feasibility of a roundabout.
6	MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps	As a long term solution, implement Alternative 2, which includes changes to the northbound lane configurations, as well as signalization of the Eastbound I-68 off-ramp. Install new overhead signs to direct traffic into the correct lane.
8	MD 51 at Lamont Street	Restrict thru and left turns from Lamont Street, and restrict left turns from southbound MD 51. Install signing directing southbound vehicles to make a u-turn at 2 nd Street and then turn right onto Lamont Street.
9	MD 51 at Virginia Avenue	Install either of the Michigan Left proposals.
<i>Improvements from Related Issues</i>		
4	Baltimore Street at Canal Street	The signal timing improvements at the nearby intersection of Baltimore Street at Mechanic Street will improve operations at this intersection.
7	MD 51 NB at Canal Parkway NB Weave	Implementation of the solutions at the intersection of MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps will improve operations in this area.

I. INTRODUCTION

A. Project Description and Purpose

The last Traffic Safety Study for the City of Cumberland was completed in October 1979 by Henningson, Durham, and Richardson. The report evaluated traffic flows, accident patterns, and traffic controls to determine how traffic patterns should be managed and directed. Recommended implementation strategies included a long list of signage and traffic control device improvements, street surface and intersection design improvements, and a number of non-engineering recommendations. Many of the study's recommendations were implemented, but several—including a truck routing system—were not addressed. Two efforts to improve directional signage for vehicular traffic were undertaken. The first was in the 1980's to provide directional signage to tourism destinations (brown signs with a train logo) and the second was a thematic signage program in downtown Cumberland to improve traffic circulation as recommended by the City's 1998 Downtown Design and Development Plan.

Since the 1979 study and the implementation of the signage programs, Cumberland has changed significantly. Traffic volumes and travel patterns have changed in response to business closures and redevelopment projects. Consequently, the City sought funding assistance for a new Traffic Circulation and Signage Study to help address these issues and provide additional guidance and scheduling justification for street improvements by the City's Pavement Management System. At the City's request, the Allegany County Department of Planning Services funded this engineering study with the following objectives in mind:

- To address complaints regarding heavy truck traffic in the downtown area and trucks getting lost on city streets not designed to handle heavy loads
- To address the need for better directional signage to help regional and non-local traffic negotiate the City's street network. The City also desires a more unified signage scheme, preferably patterned in accordance with the 1998 Downtown Design and Development Plan.

To further the objectives of this study, the City assembled a group of local stakeholders comprised of the City Engineer and City Planner, representatives of City/State Police, City Fire Department, Tourism Director, and several community and business representatives with the intent of tapping into this base of local knowledge to gain a broader understanding of traffic operations and safety issues in the City. The list of stakeholders who participated is contained in Appendix A.

The City contracted with Whitman, Requardt and Associates, LLP (WR&A) to perform the study. WR&A had worked with the City in the past on related projects, such as Ridgely, WV Truck Restriction Signage Project. WR&A has also worked on many projects with the Traffic staff of the Maryland State Highway Administration's District 6 office, the staff within SHA responsible for traffic engineering in Allegany County.

B. Location And Study Area

The study area includes the entire City of Cumberland. The streets/intersections that were studied based on guidance from the Project Manager and the steering committee are shown in Figure 1.

II. DATA COLLECTION AND ANALYSIS**A. Background Data**

WR&A staff obtained the following data:

- Topographic mapping of the entire City
- Documentation of current tourist destination signing and thematic signing
- Information on high crash locations for SHA maintained roadways in the City, both for road segments and intersections (from SHA's Traffic Safety Analysis Division and City records)
- Road segment traffic volumes from City records
- Sight distance study at one intersection of concern to the stakeholder committee (MD 51 at Lamont Street)
- License plate study of trucks traveling through downtown along Mechanic Street (conducted on March 23, 2010).

B. Intersection Counts

Traffic/pedestrian counts were performed at the following seven intersections:

- Mechanic Street at Queen City Drive
- Baltimore Street at Mechanic Street
- Baltimore Street at Canal Street
- Baltimore Street/Washington Street at Cumberland Street/Greene Street
- MD 51 at Queen City Drive/Mechanic Street/Centre Street/Winston Street/I-68 Ramps
- MD 51 at Lamont Street
- MD 51 at Virginia Avenue

At six of these intersections, counts were performed during the AM peak period of 7:00 to 9:00 AM, and during the PM peak period of 3:00 to 5:00 PM. A thirteen-hour count was performed at the intersection of Mechanic Street at Queen City Drive between the hours of 6:00 AM and 7:00 PM for the purpose of a signal warrant study. Traffic count data can be found in Appendix B.

FIGURE 1 - STUDY AREA

C. Field Inventory and Traffic Observations

Field inventory and traffic observations of the major streets and intersection problem areas identified in the Stakeholder meeting were conducted during the one-week period of October 19 – 22, 2009. Specific data obtained included:

- Inventory of current guide signing
- Geometric features and constraints along the major routes
- Traffic operations and potential trouble spots
- Truck turning movements and opportunities for alternative routing, (included travel time/delay run on several routes)
- Pedestrian/bicyclist patterns
- Traffic control devices, such as traffic signals, that are either not operating properly or are in need of modernization or upgrading (WR&A's assigned traffic engineer was accompanied by Mr. Einer Johnson, a member of the stakeholder committee, to seven of the City's signalized intersections to view control equipment)

III. ISSUES OF CONCERN

Issues of concern were identified based on direct field observations as well as discussions and comments from stakeholder meeting. Figure 2 shows a map of the City of Cumberland with the locations of these issues. These issues are described in Table 1 with brief descriptions of the potential concerns. In addition to the ten issues shown in Figure 2, there are three citywide issues.

FIGURE 2 – ISSUES OF CONCERN

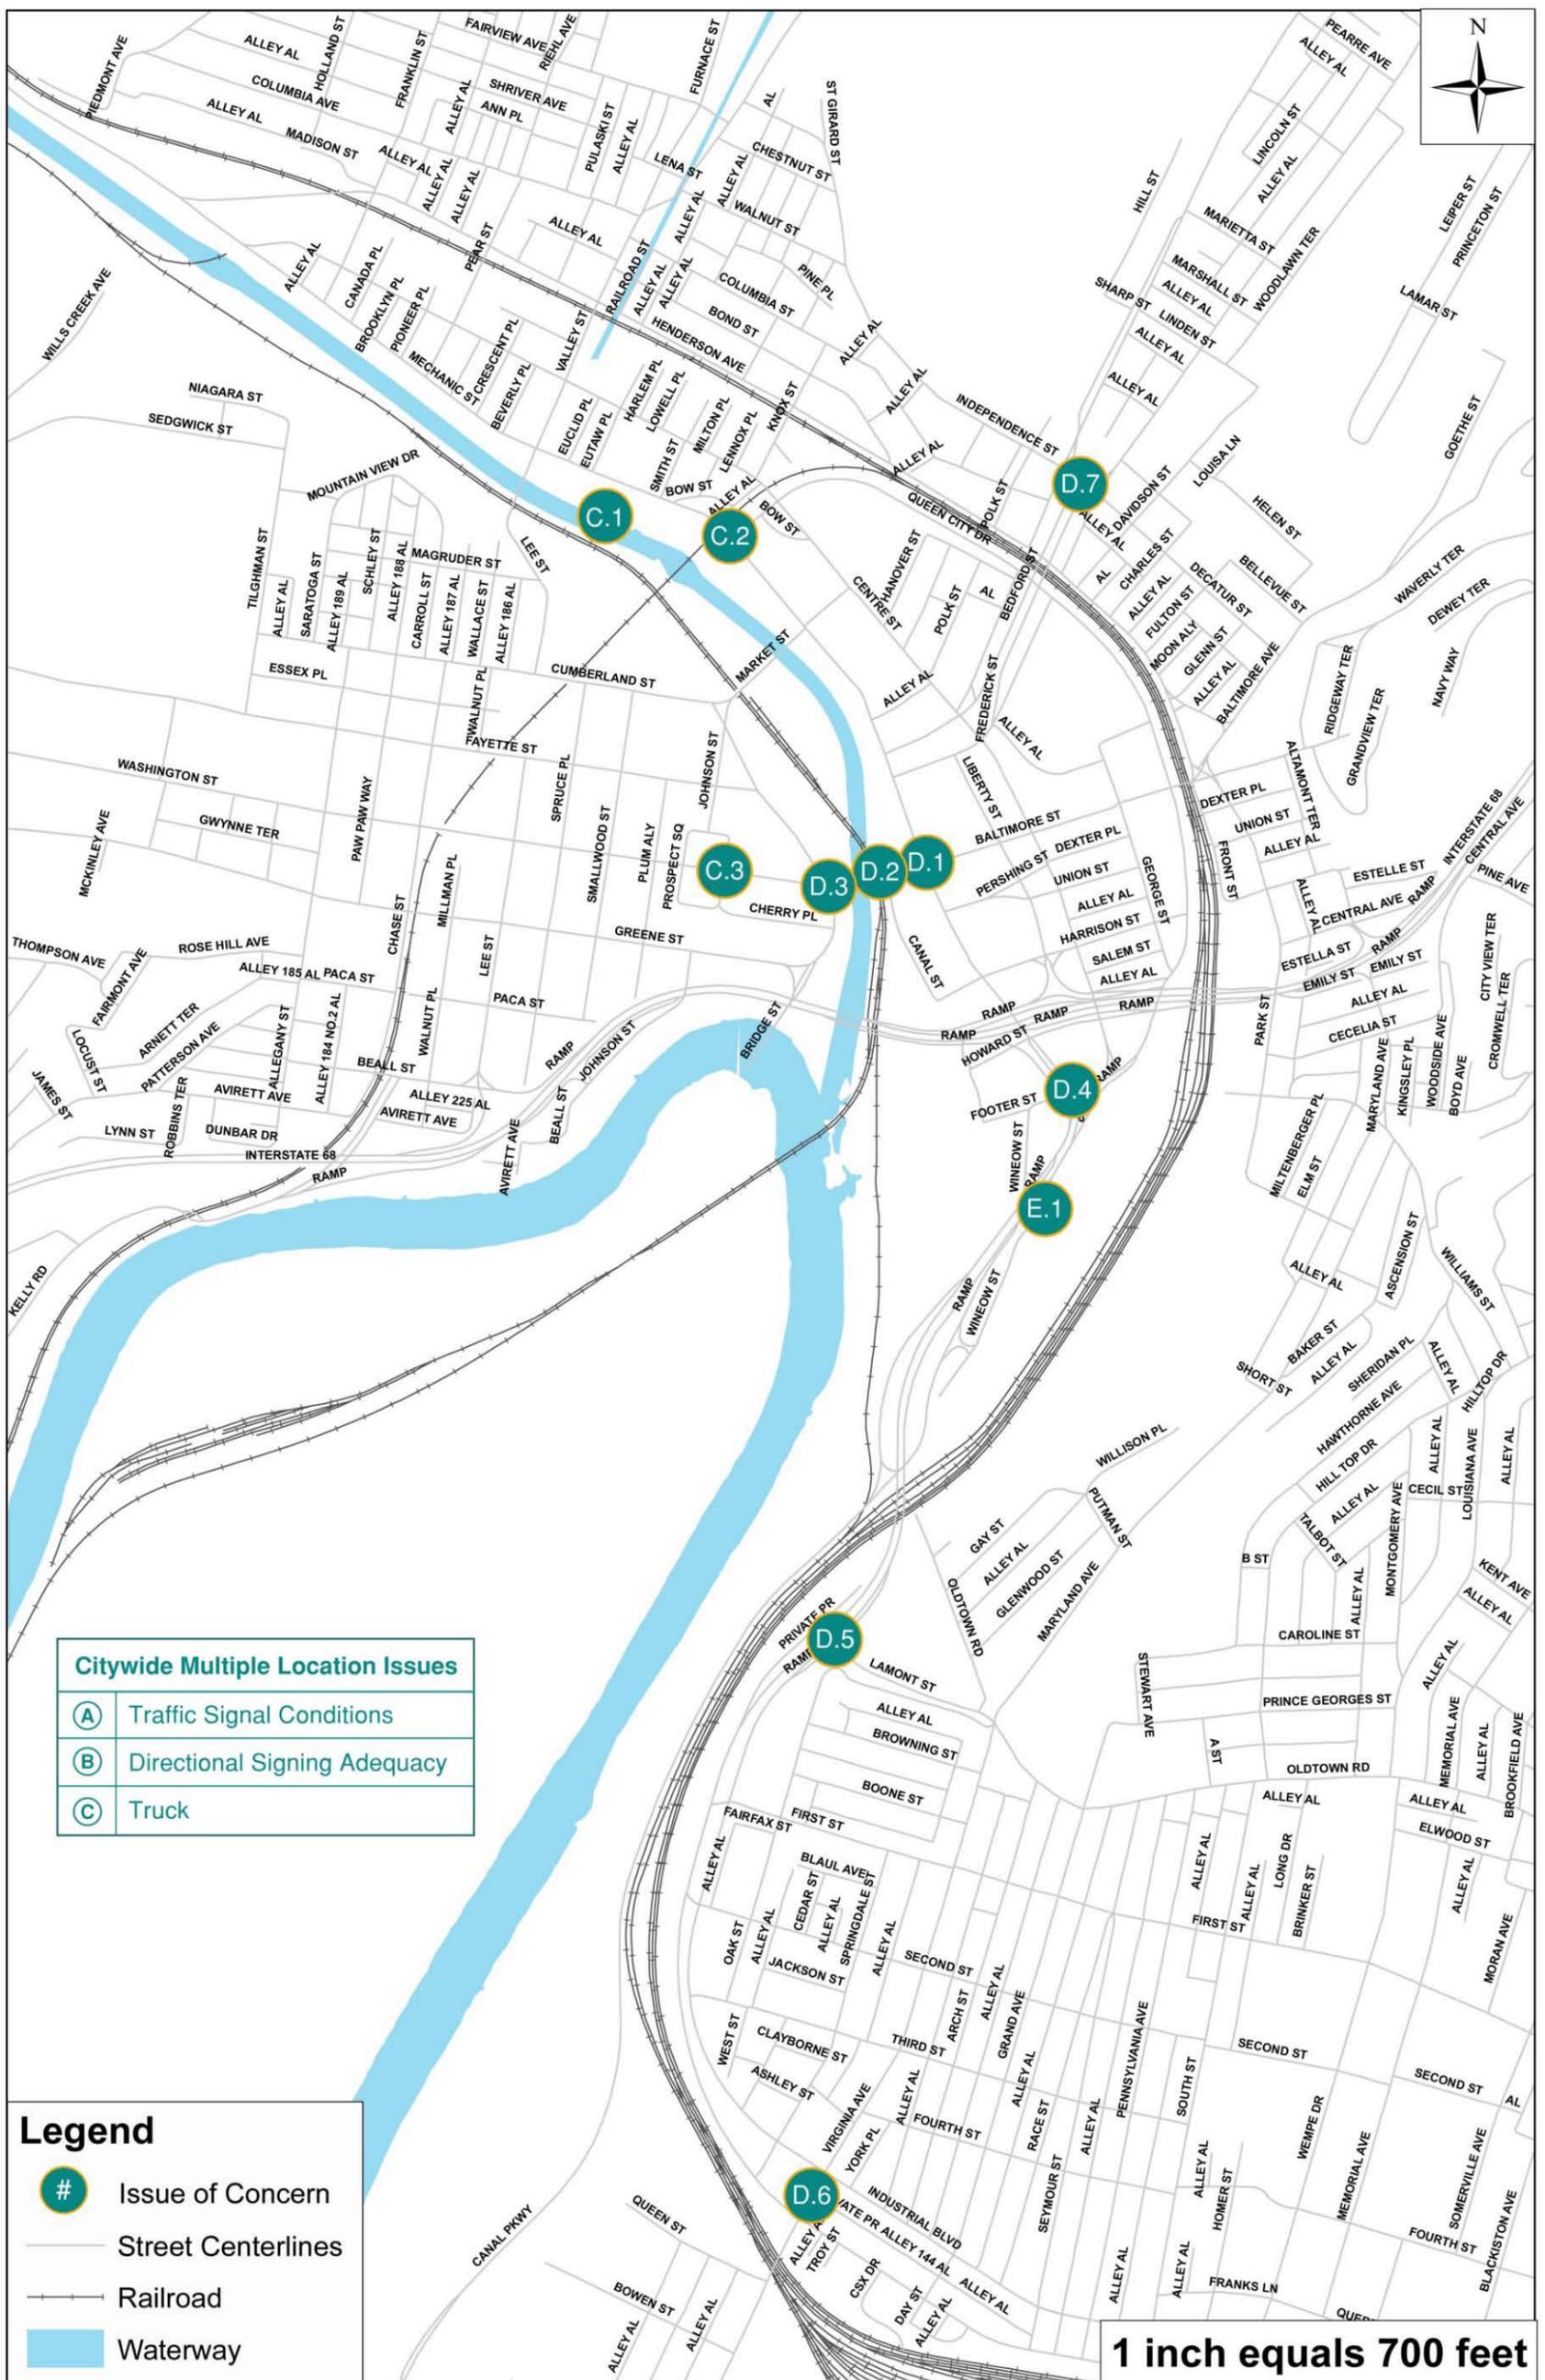

Table 1. Issues of Concern

Issue	Location	Description
A	Citywide	Traffic Signal Conditions
B	Citywide	Directional Signing Adequacy
C	Various	Truck Travel Issues
C.1	Mechanic Street in downtown Cumberland	Businesses are concerned about noise and vibration from trucks traveling through downtown Cumberland
C.2	Mechanic Street at Queen City Drive (north side)	Better accommodate trucks that travel under the nearby low-clearance bridge; examine feasibility of installation of a traffic signal
C.3	Baltimore Street/Washington Street at Cumberland Street/Greene Street	Trucks travel on a truck-restricted section of Washington Street
C.4	Multiple Locations	Questionable truck turning geometrics
D	Various	Intersection Operation Issues
D.1	Baltimore Street at Mechanic Street	Determine signal phasing/timing to best serve pedestrian and vehicular traffic
D.2	Baltimore Street at Canal Street	Examine pedestrian accommodations and turning traffic
D.3	Baltimore Street/Washington Street at Cumberland Street/Greene Street	Confusing intersection; vehicle right-of-way conflicts
D.4	MD 51 at Queen City Drive/ Mechanic Street/ Centre Street/ Winston Street/I-68 Ramps	Signal timing and queuing issues
D.5	MD 51 at Lamont Street	Restricted sight distance for traffic turning left from Lamont
D.6	MD 51 at Virginia Avenue	Delays and queuing problems
D.7	McMullen Bridge	Develop signing to direct more traffic to the westbound lanes of the bridge
E.1	MD 51 NB at Canal Parkway	Vehicle weaving conflicts

The following is a detailed description of each issue, along with an assessment of potential solutions. Issues A, B, and C involve assessments of current conditions. Issues 1 and 10 involve signing and marking improvements only. Issue 5 consists of a solution that involves signing only, and alternative solutions that involve signalization and/or geometric improvements. All other issues involve operational improvements.

A. Traffic Signal Condition

WR&A's assigned traffic engineer was accompanied by Mr. Einer Johnson, a city resident who is a member of the stakeholder committee, to six of the City's signalized intersections to view control equipment. Mr. Johnson volunteers his services and helps the City to troubleshoot signal timing, phasing and electrical problems. He formerly worked for the City of Baltimore's traffic signal electronics shop as a maintenance technician. He has also been able to assist the City in procuring used traffic controllers, cabinets and conflict monitors from Baltimore that became expendable when they modernized their traffic control system. That equipment is currently in use at three intersections.

Following is an assessment of the signal equipment at the seven intersections visited. Figures 3A, 3B, and 3C show examples of the equipment.

- Queen City Drive at Centre Street (Figure 3A)
 - The control cabinet is not sealed and, to prevent water intrusion, it has been covered with a garbage bag.
 - Loop detection is not working along southbound Queen City Drive and that movement has been placed on recall (i.e. signal changes to serve QCD whether or not vehicle is present).
 - The northbound loops are working with no problems.
- Centre Street at Valley Street
 - The northbound Valley Street thru lane needs a new loop.
 - The signal is operating on recall for the Valley Street approaches, and provides a 20-second phase length.
- Mechanic Street at Valley Street – the pedestrian signals have been removed.
- Mechanic Street at Henderson Avenue – the westbound Mechanic Street loop has been removed.
- Henderson Avenue at Pear Street (Figure 3B) – the northbound Pear Street signal heads are covered to prevent vandalism.
- Henderson Avenue at Knox Street (Figure 3C)
 - The controller has telephone communication, but the communication has not worked in over three years.
 - The signal provides 34 seconds to Knox Street every time a vehicle is detected, which causes excessive delay along Henderson Avenue.

**FIGURE 3A
QUEEN CITY DRIVE AT
CENTRE STREET
CONTROLLER**

**FIGURE 3B
HENDERSON AVENUE AT
PEAR STREET
COVERED SIGNAL HEAD**

**FIGURE 3C
HENDERSON AVENUE AT
KNOX STREET
CONTROLLER**

Additional problems with traffic signal equipment were raised at the steering committee meeting and in discussions with Mr. Johnson:

- The intersections in downtown, many of which are closely spaced, are not interconnected, and therefore operate as a series of isolated intersections, which leads to inefficient operations and unnecessary delays.
- Four different brands of controllers and a mix of control cabinet brands/generations are used at the twenty two signalized intersections in the City. When a signal goes out of service due to a knockdown, part failure or for some other reason, it can remain out of service for an extended period of time, depending on the availability of a compatible

controller. This was the case recently at the intersection of Queen City Drive at Baltimore Street, which has a railroad pre-emption circuit. Mr. Johnson was able to fashion a temporary fix to get the signal operating in flashing mode, but it wasn't until the controller manufacturer could send out a representative from Florida that the permanent repair could be installed.

The deteriorating condition of the signal equipment is the most serious of the traffic-related problems that was observed during the study. The City should consider a staged modernization of all signal equipment, starting with the equipment in Downtown, which has the heaviest concentration of traffic and pedestrians, most complex intersections and inter-related signal operations, and the greatest need for a well-functioning, modern signal system. A more detailed study of the signalized intersections is needed to identify the cost of such a modernization program; however, as a rough estimate, the City of Winchester, Virginia is very near completion of a traffic signal modernization program that was implemented at a cost of approximately \$150,000 per intersection for equipment modernization (complete rebuilds) and an additional \$5,000 per intersection for retiming (4 timing plans per intersection).

B. Directional Signing Adequacy

As has been noted through various discussions with City staff and the stakeholder group there is a perception that Cumberland's street system is confusing, making navigation difficult for unfamiliar drivers. Some of this confusion could be a result of the discontinuity in the street system. Barriers, both natural (Potomac River and Willis Creek) and man-made (I-68 Viaduct, Railroad, Baltimore Street Pedestrian Mall) have resulted in street rerouting and closures. In addition, certain streets are one-way for portions only, further complicating drivers' understanding of the street network. Although outside the scope of this study, a comprehensive review of the street network, including review of one-way patterns could provide options for simplifying Cumberland's street network.

Although Cumberland's street system can be confusing, there are several guide signing systems in place to guide unfamiliar drivers to select sites through the City. These existing guide signs were inventoried by WR&A (see Appendix F). Most are in good to poor condition. The majority of the signs provide messages that are adequate and relevant to motorists. Most of the signing issues noted below are more global in nature and do not specifically relate to a particular sign or routing issue.

- **Street Name Sign Letter Type and Size.** The current edition of the MUTCD (2009) requires that all street name signs be composed of an initial upper case letter followed by lower case letters. Typically the street name signs within the City contain all uppercase letters. In addition, the MUTCD requires that overhead street name signs contain a 12" initial upper case letter followed by a 9" lower case letters. The larger text size will increase the size of the sign substantially. This combination of mixed case text and larger text has been found to provide better recognition by motorists. The deadline for updating signs to conform

with the 2009 MUTCD is January 9, 2012 for 6" initial upper case letter followed by lower case letters on post mounted signs; and December 22, 2018 for overhead street name signs containing a 12" initial upper case letter followed by a 9" lower case letters.

- **Message Inconsistency.** Most guide signs in downtown are of a decorative type with curved tops and consist of three types – Destination, Parking, and Marquee signs. In addition, there are brown “Historic Cumberland” signs that contain similar messages. All of these signs are intended to guide tourists and unfamiliar drivers once they are on the city streets, and most of these drivers use I-68 to reach Cumberland. Ideally, to avoid motorist confusion, the messages displayed on I-68 would be consistent with the City’s directional sign messages. In at least two cases, this is not so, and in many cases, destinations that are signed on the City’s signs are not mentioned on the highway. These cases are described in Table 2.

Table 2. Comparison of Highway and Local Street Sign Messages

SHA I-68 Destination Messages	City Directional Sign Messages
Inconsistent Messages	
Tourist Info	Visitor Center
Western MD Station Center	Canal Place/Bike Trail
Consistent Message	
Scenic RR	Scenic Railroad
Destinations Not Signed on I-68	
Not Signed	Shops and Dining
	Historic Downtown
	Transit Stations (Amtrak, Bus)
	Parking (Public, Permit, Hourly)
	City Hall
	Washington Street Historic District

It is neither expected nor practical to sign all tourist destinations in the City on I-68. SHA has developed the Tourism Area and Corridor Signing Program to address such situations. The program consultants typically begin the process by conducting a geographical analysis of attractions and then develop a preliminary breakdown of the region into tourism areas and corridors. Tourists are first guided to areas, then corridors, then individual attractions. The City should work with Allegany County to coordinate with SHA to consider Cumberland for the TAC Program.

- **Sign Layout.** The majority of the City’s directional signs are sized to fit within the constraints of an urban environment; however, the size of the text used is smaller than minimum allowed (6" upper case/4" lower case) and/or the spacing has been compressed

to make messages fit. In addition, some signs contain route marker shields to guide motorists, which are very helpful to guide the motorist; however, the size of these shields is approximately 9", almost a third of the minimum shield size of 24". The small size of these legend elements may not allow all drivers to read and react to these signs, rendering them useless. Another consideration is the color of the signs, which should meet Federal contrast requirements. Use of standard guide sign colors (white on green/blue/brown) will ensure signs meet these requirements. Also, the signs are typically painted, with no retro-reflective qualities. Using retro-reflective sheeting would enhance the night time visibility of these signs. Figures 4A – 4H show examples of the different types of signs throughout the City.

C. Truck-Related Issues

During the field inventories and associated studies of City mapping, potential constraints, conflicts, and controlling factors were identified that could affect truck travel or the selection of future improvement alternatives throughout the City. Identified issues include the following:

1. Truck Travel along Mechanic Street through Downtown

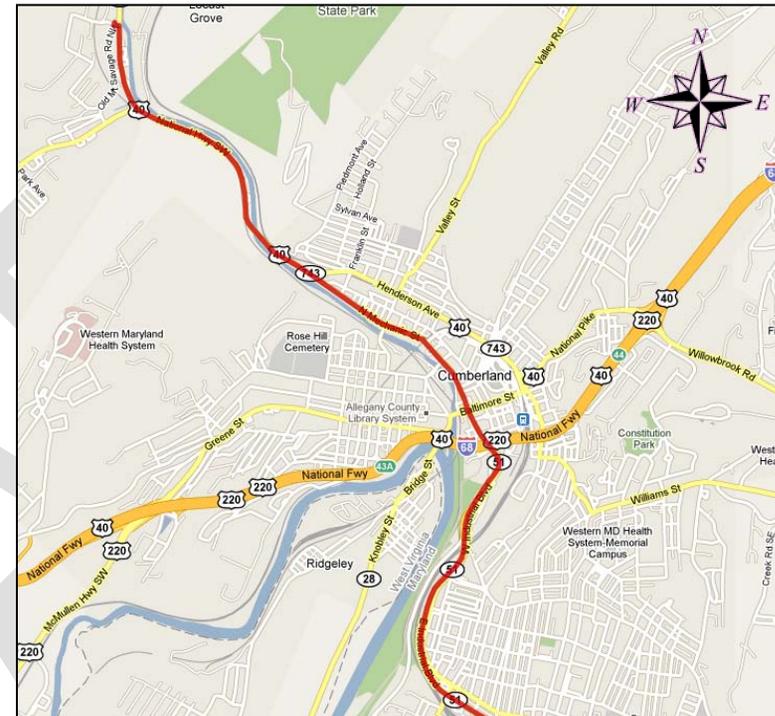

a. Problem

Many residents and businesses have complained about truck traffic on Mechanic Street in downtown Cumberland. Of particular concern to the City are coal trucks that travel from coal mines in southern Pennsylvania to the Warrior Run power plant south of the city on Mexico Farms Road. Additionally, many large trucks travel through downtown to access I-68 and US 220. A survey of truck traffic taken on Tuesday, March 23, 2010, showed that out of 111 trucks that traveled southbound through Mechanic Street north of the city and/or downtown at Harrison Street, only 21 passed through both points, one of which turned right onto Howard Street. The vast majority of trucks that travel along Mechanic Street have destinations within the City. Of the 20 vehicles that can be classified as through traffic, 14 continued southbound along MD 51, and 6 took the on-ramp to Eastbound I-68. No coal trucks were observed on the day the truck study was conducted.

The route that trucks take along Mechanic Street from north of the city to the power plant is displayed in Figure 5, along with details of this route. Details of travel time runs can be found in Appendix D. The 7.8-mile route takes approximately 15 minutes. After passing through the city, trucks continue southbound along MD 51 to reach the power plant.

**FIGURE 5 – TRUCK ROUTE ALONG MECHANIC STREET
 7.8 MILES – 15 MINUTES**

- Travel SB along MD 36
- Turn left onto US 40 Alt. (becomes Mechanic Street, then becomes SB MD 51)
- Turn right at Mexico Farm Road
- End at Warrior Run Power Plant

DRAFT

b. Potential Solutions

There are three alternate routes that through trucks could follow that would reduce truck traffic through downtown Cumberland while maintaining a reasonable travel time and travel distance for these trucks. Signing improvements would help to divert truck travel along Mechanic Street by directing trucks to alternate routes. The three detour routes begin just north of the MD 36 at US 40 Alt. intersection north of the city. Travel time runs were conducted along the Mechanic Street route as well as the proposed detour routes. The proposed detour routes are displayed in Figures 6A, 6B, and 6C, along with their respective travel distances, travel times, and route details. Details of travel time runs can be found in Appendix D. After passing through the city, all routes continue southbound along MD 51 to reach the power plant.

**FIGURE 6A – DETOUR ROUTE A
12.8 MILES – 20 MINUTES**

- Travel SB along MD 36
- Turn right onto US 40 Alt.
- Turn left onto Campground Road (becomes Vocke Road)
- Turn left onto the I-68 EB On-Ramp
- Exit onto SB MD 51
- Turn right at Mexico Farm Road
- End at Warrior Run Power Plant

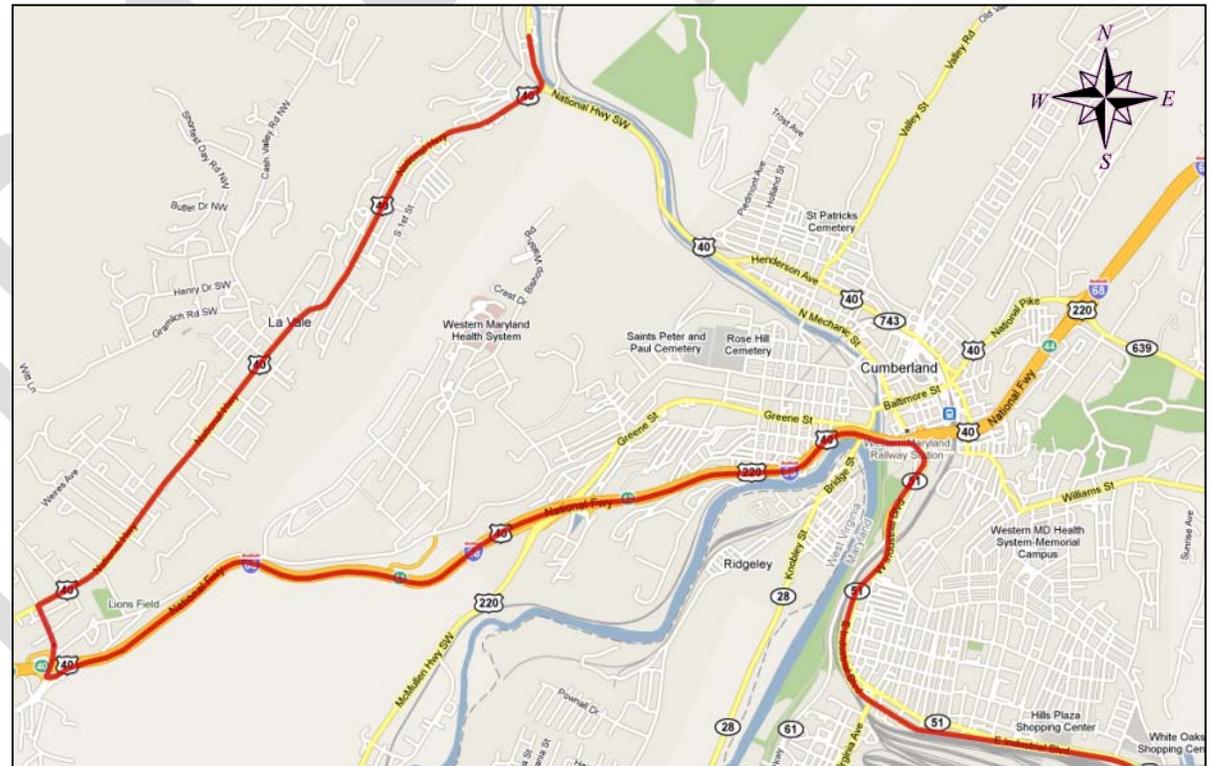

FIGURE 6B – DETOUR ROUTE B
8.1 MILES – 15 MINUTES

- Travel SB along MD 36
- Turn left onto US 40 Alt. (becomes Mechanic Street)
- Turn left onto Queen City Drive
- Turn left onto SB MD 51
- Turn right at Mexico Farm Road
- End at Warrior Run Power Plant

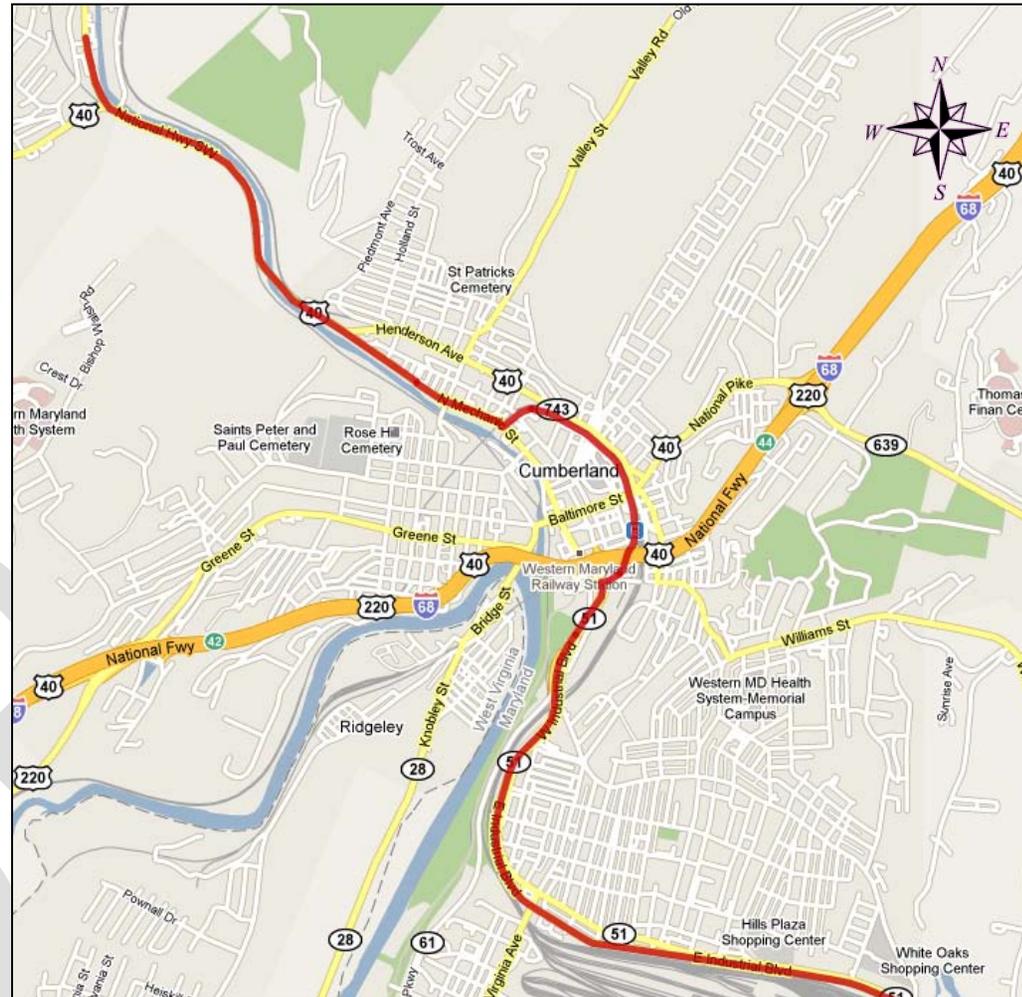

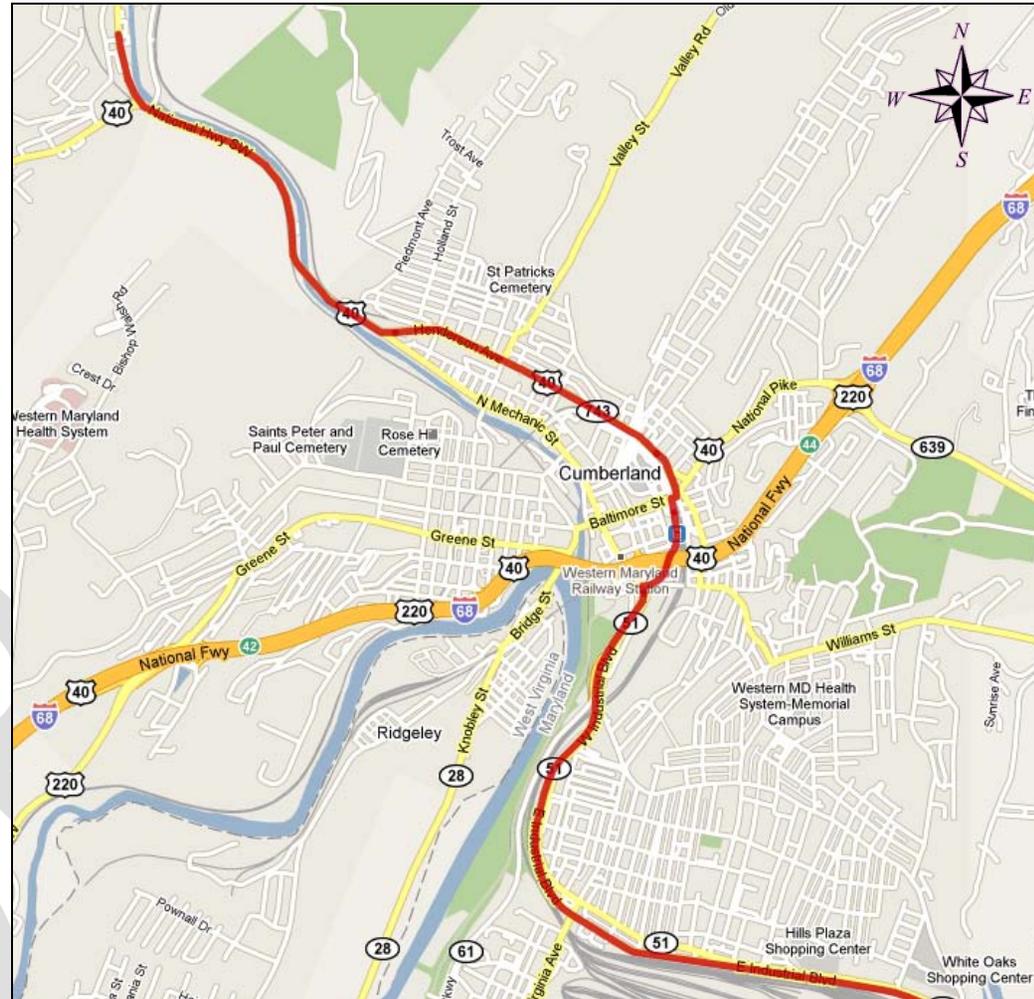

FIGURE 6C – DETOUR ROUTE C
8.1 MILES – 16 MINUTES

- Travel SB along MD 36
- Turn left onto US 40 Alt.
- Turn left onto Henderson Avenue (becomes Front Street)
- Turn right onto Baltimore Street
- Turn left onto Queen City Drive
- Turn left onto SB MD 51
- Turn right at Mexico Farm Road
- End at Warrior Run Power Plant

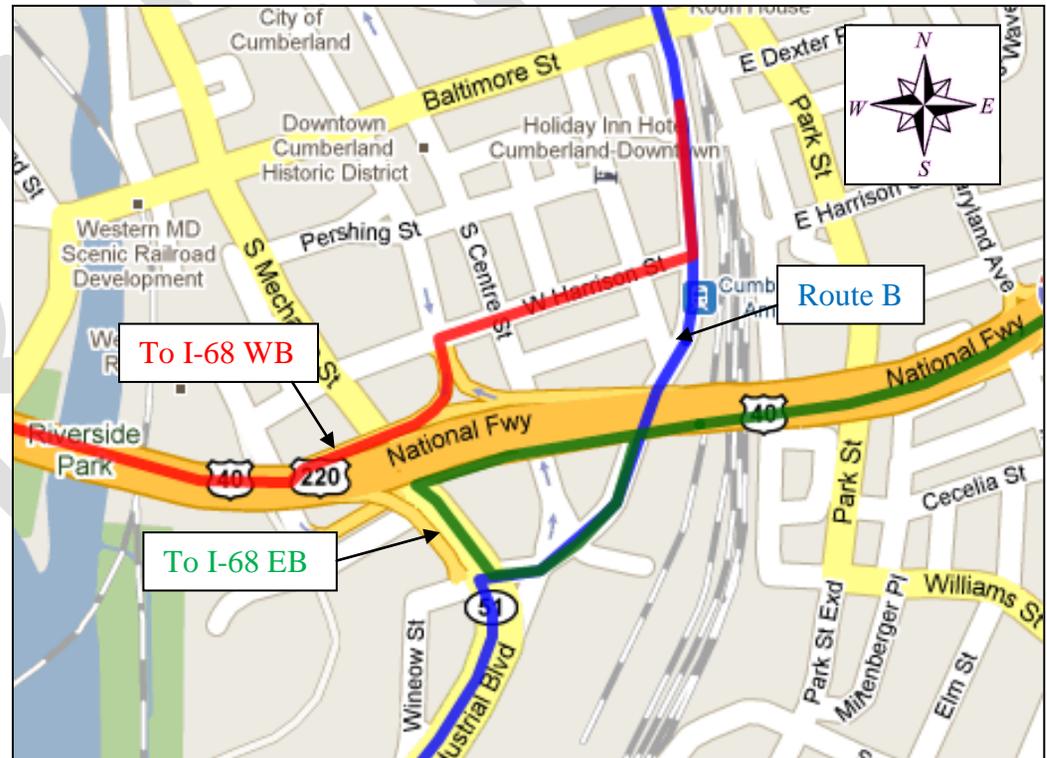

As shown, Route B has the shortest average travel time, which is approximately identical to that of the route along Mechanic Street through downtown. Routes B and C have approximately the same travel distance, which is significantly shorter than that of Route A, and about 0.3 miles longer than the route along Mechanic Street. While Route C's travel time is only about one minute longer than that of Route B and the route along Mechanic Street, trucks may have difficulty traveling between the two closely-spaced intersections of Front Street at Baltimore Street and Baltimore Street at Queen City Drive. Trucks traveling along this route would travel SB along Henderson Avenue, turn right onto Baltimore Street, and then immediately turn left onto Queen City Drive. This maneuver may make Route C a less-than-desirable route. Route A would minimize travel time through the City of Cumberland and would take trucks off of Mechanic Street everywhere south of Henderson Avenue; however, travel time and travel distance along this route is greater than along either of the other two routes.

c. Recommendation

In order to direct traffic along Route B, install signs along Mechanic Street north of its intersection with Queen City Drive restricting trucks along Mechanic Street beyond Queen City Drive, with an exception of local deliveries.

In addition to coal trucks traveling to the power plant, trucks wishing to reach I-68 should also follow Route B. As shown in Figure 7, when trucks are driving along Queen City Drive, they may turn right onto Harrison Street to access I-68 Westbound or turn right onto Mechanic Street to access I-68 Eastbound. Alternatively, if trucks have difficulty making the turn onto Centre Street, they may turn right onto Mechanic Street, then right onto Harrison Street to turn right onto the ramp to I-68 Eastbound.

FIGURE 7 – ROUTES TO I-68 FROM ROUTE B

2. Mechanic Street at Queen City Drive (North Side)

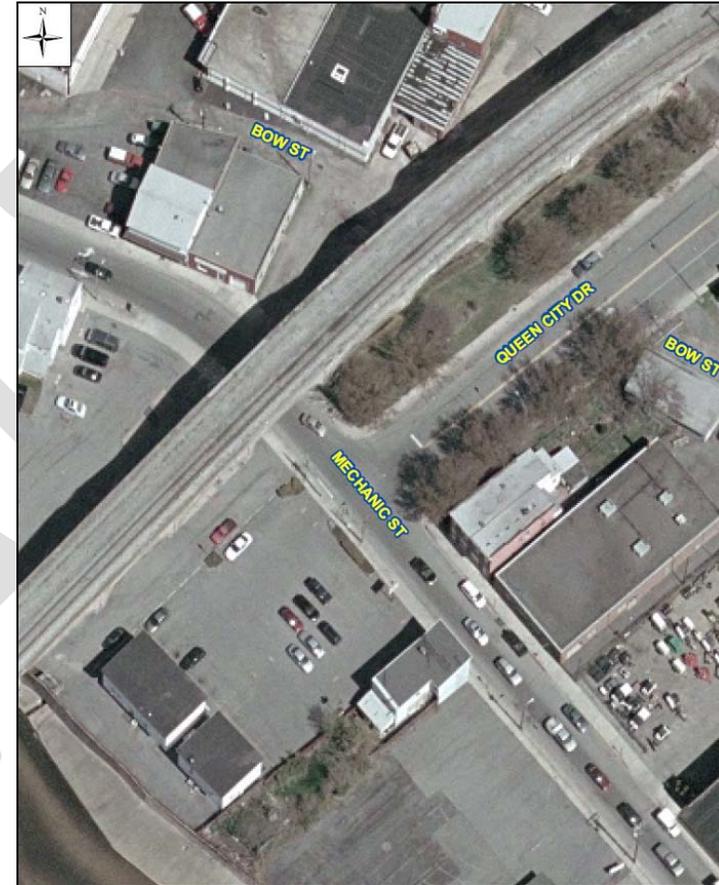

a. Problem

This intersection (see Figure 8), which is located in the northern section of Cumberland, is a stop-controlled intersection. It is located at the north end of the truck detour proposed under Issue C.1.

Queen City Drive terminates at Mechanic Street, and there is a parking lot on the opposite side of the intersection from Queen City Drive, which serves as the eastbound leg of the intersection. Mechanic Street is one-way southbound, with a thru lane and a left-turn lane upstream of the intersection. There is one travel lane downstream of the intersection, along with a parking lane on the left side of the roadway. Queen City Drive is a two-lane roadway with parking along both sides. Stop-sign control is present along the westbound Queen City Drive approach and the eastbound parking lot approach.

Approximately 40 feet north of the intersection, there is a bridge over Mechanic Street with a vertical clearance of 14'-0" in the center of the roadway, 11'-6" along the left side of the roadway, and 12'-0" along the right side of the roadway, as shown in Figure 9 below. Several trucks were observed traveling through the center of the roadway, straddling the southbound thru lane and the southbound left-turn lane, to clear the bridge. Additionally, there are concerns about whether eastbound and westbound vehicles receive enough gaps in southbound traffic to clear the intersection with minimal delay.

FIGURE 8 – MECHANIC STREET AT QUEEN CITY DRIVE

b. Potential Solutions

Installation of a traffic signal at this intersection had been considered to provide eastbound and westbound traffic with a phase independent from southbound traffic so that vehicles along these approaches would not have to wait for gaps in southbound traffic to clear the intersection. A thirteen-hour count was performed at this intersection on Wednesday, December 16, 2009 from 6 AM to 7 PM for the purpose of a signal warrant study. Table 3 provides a summary of the signal warrant analysis. Detailed signal warrant analysis can be found in Appendix E. As shown in Table 3, the warrant is not met. Warrants 1 and 2, which require minimum vehicular volumes to be met during at least 8 hours and 4 hours respectively, are not met during any hour.

FIGURE 9 –VERTICAL CLEARANCE ALONG SOUTHBOUND MECHANIC STREET

**TABLE 3 – SIGNAL WARRANT ANALYSIS SUMMARY
MECHANIC STREET AT QUEEN CITY DRIVE (NORTH SIDE)**

Md-MUTCD Warrant	Criteria			No. of Hours or Criteria Observed	Warrant Satisfied
	Major Street Volume (VPH)	Minor-street Volume (VPH)	No. of Hours Required		
1A – Minimum Vehicular Volume	500	150	8	0	NO
1B – Interruption of Continuous Traffic	750	75	8	0	
1C – Combination Warrant 80% of Warrants 1A & 1B (56% of Warrants #1A & 1B)	400 600	120 75	8	0	
2 – Four-Hour Warrant	(See Appendix for charts)		4	0	NO
3A – Peak-Hour Delay Warrant	Total Delay > 4 Veh-hours		1	0	NO
	Approach Volume ≥ 100 VPH			38	
	Total Entering Volume ≥ 800 VPH			656	
3B – Peak-Hour Volume Warrant	(See Figure 4C-1 and 4C-2 in Appendix E)		1	0	
4 – Pedestrian Volume	100 or more pedestrians for any 4 hours <u>OR</u> 190 or more pedestrians during any 1 hour <u>AND</u> Fewer than 60 gaps/hr of adequate length for peds to cross during same period observed above.			N/A	N/A
5 – School Crossing	Intersection is not used as crossing for school children.			N/A	N/A
6 – Coordinated Signal System	In order to maintain proper grouping of vehicles within a signal system.			N/A	N/A
7 – Crash Experience	Five or more reported crashes, of types susceptible to correction by a traffic signal, have occurred in a 12-month period. Also, 80% of either Warrant #1 or Warrant #2 is satisfied.			80% of either Warrant #1 or Warrant #2 not satisfied	NO
8 – Roadway Network	Intersection of two major roadways.			NO	NO

Analysis was performed using SimTraffic simulation software during the AM peak hour of 11:00 AM to Noon and the PM peak hour of 3:00 to 4:00 PM. Table 4 summarizes the results of SimTraffic analysis. Detailed SimTraffic output is included in Appendix E. As shown, the intersection currently operates at LOS A during both peak hours. Vehicles along the minor approaches have low average delay times. During peak hour observations, frequent gaps in southbound traffic were observed, and delay times for vehicles along the minor approaches were low.

TABLE 4 – SIMTRAFFIC ANALYSIS SUMMARY
MECHANIC STREET AT QUEEN CITY DRIVE (NORTH SIDE) – EXISTING CONDITIONS

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
SB Mechanic Street	0.6	A	4	0.6	A	7
EB Parking Lot	5.3	A	27	4.7	A	23
WB Queen City Drive	7.8	A	50	8.3	A	48
Intersection Summary	1.3	A	--	1.1	A	--

In order to address the issue of southbound truck drivers traveling through the southbound thru lane and the southbound left-turn lane simultaneously and to improve the turning geometrics for trucks following the diversion route proposed under Issue C.1 (see discussion under C.4), the southbound left-turn lane can be removed, requiring all southbound traffic to use a single lane, which would be placed in the center of the roadway where the clearance is the greatest. As shown in Table 5 below, removal of the southbound left-turn lane would have a minimal impact on operations. Average delay would increase by 0.5 seconds during each peak hour, and LOS would remain unchanged. Detailed SimTraffic output can be found in Appendix E.

To better accommodate southbound left-turning truck traffic, the westbound lane of Queen City Drive should be relocated to the right, to provide more room for southbound turns to safely make their turning movement. Parking along this approach would have to be removed to accommodate the relocation of the travel lane. If parking is in high demand in this area, more parking could be provided along Mechanic Street north of the intersection if the left-turn lane here is removed, in the areas where there are not adjacent driveways.

**TABLE 5 – SIMTRAFFIC ANALYSIS SUMMARY
MECHANIC STREET AT QUEEN CITY DRIVE (NORTH SIDE) – PROPOSED CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
SB Mechanic Street	1.1	A	4	1.1	A	8
EB Parking Lot	4.9	A	27	4.0	A	23
WB Queen City Drive	8.9	A	53	9.6	A	48
Intersection Summary	1.8	A	--	1.6	A	--

A traffic signal warrant analysis was performed under the proposed geometry. Table 6 provides a summary of this analysis. Detailed signal warrant analysis can be found in Appendix E. As shown, no warrants are met under this geometry.

c. Recommendation

Signing and marking improvements are recommended at this intersection, which include removal of the southbound left-turn lane of Mechanic Street as well as the relocation of the westbound lane of Queen City Drive. A signal is not recommended for this location.

TABLE 6 – SIGNAL WARRANT ANALYSIS SUMMARY
MECHANIC STREET AT QUEEN CITY DRIVE (NORTH SIDE) – PROPOSED GEOMETRY

Md-MUTCD Warrant	Criteria			No. of Hours or Criteria Observed	Warrant Satisfied
	Major Street Volume (VPH)	Minor-street Volume (VPH)	No. of Hours Required		
1A – Minimum Vehicular Volume	500	150	8	0	NO
1B – Interruption of Continuous Traffic	750	75	8	0	
1C – Combination Warrant 80% of Warrants 1A & 1B (56% of Warrants #1A & 1B)	400 600	120 75	8	0	
2 – Four-Hour Warrant	(See Appendix for charts)		4	0	NO
3A – Peak-Hour Delay Warrant	Total Delay > 4 Veh-hours		1	0	NO

8 – Roadway Network	Intersection of two major roadways.			NO	NO

d. Trucks on Washington Street

Trucks traveling westbound along Baltimore Street through the intersection of Washington Street/Cumberland Street/Greene Street that are destined for Ridgely, WV or westbound Interstate 68 will sometimes inadvertently continue westbound along Washington Street. Washington Street is an inadequate route for trucks for three reasons. First, Washington Street is a residential street. It is narrow in several areas, which is particularly problematic for trucks and many residents have complained about these stray trucks. Second, Washington Street becomes one-way eastbound at Kiefer Avenue. At this point, trucks must turn right onto Kiefer Avenue and then make a hard left onto Fayette Street to reach Braddock Road and Greene Street. Finally, there is a weight-restricted bridge over the railroad, east of Chase Street (Single Unit 15,000 lbs GVW, Combination Unit 22,000 lbs GCW).

The intended route for trucks traveling westbound along Baltimore Street at the Washington Street/Cumberland Street/Greene Street is along Greene Street, which can accommodate large trucks and provides the most direct access to points west of the City. Some of the directional signs around the Baltimore Street/Washington Street/Cumberland Street/Greene Street intersection contain the message "Washington Street Historic District".

Recommendations: The City should add the regulatory message "NO TRUCKS" below the guide message to help alert trucks to the existing truck restriction along Washington Street. In addition, the approach to this intersection is one that contains the undersized I-68 route shield on the historic sign panel, as previously discussed. Using a standard shield would provide much better direction for trucks destined for the interstate.

e. Inadequate Truck Turning Radii

Locations: Based on field-observations, a review of existing and proposed truck routes, and stakeholder comments, the following turning movements throughout the City may be difficult for trucks to execute due to existing intersection geometrics such as tight corner radii, narrow lanes, skewed approach angles, etc.

- Southbound left turns from Mechanic Street onto Queen City Drive (north side of City)
- Westbound left turns from Harrison Street onto I-68 Westbound On-ramp at Liberty Street
- Southbound right turns from Queen City Drive onto Harrison Street
- Westbound right turns from Queen City Drive onto Centre Street (north side of City)
- Westbound left turns from Queen City Drive/Winston Street onto southbound MD 51
- Westbound right turns from Winston Street onto Mechanic Street
- Westbound left turns from Harrison Street onto Mechanic Street

Analyses: To quantify any problematic maneuvers, AutoTURN software was used to assess locations where tractor-trailer trucks have difficulty making turning maneuvers. AutoTURN is a CAD-based software tool that specifically evaluates vehicle paths and clearances through intersections for various vehicle types. For this project, vehicle centerline paths were drawn to scale on aerial

photographs, and truck turning envelopes were simulated for standard WB-50 tractor-trailer trucks. The turning envelopes indicated the paths of the front and rear overhangs of the truck being evaluated. The analyses are summarized in Table 7. Graphics displaying the results of AutoTURN analyses can be found in Appendix C.

Table 7. Intersection Geometric Concerns

Intersection	Movement of Concern	Assessment
Mechanic Street at Queen City Drive (North Side of City)	SBL	With parking and striping changes proposed under C.2, trucks can execute this turn.
Harrison Street at I-68 Westbound On-ramp/Liberty Street	WBL	Geometrics are just barely inadequate for trucks to execute the turn. Minor encroachment on the mountable island at the ramp entrance required for trucks to execute the turn. If C.1 diversion plan is implemented, modifications to the island should be made.
Queen City Drive at Harrison Street	SBR	Trucks can only execute this turn by swinging wide into the left lane of Queen City Drive, which is not an unusual maneuver in an urban setting.
Centre Street at Queen City Drive (North Side of City)	WBR	Trucks can only execute this turn by swinging wide into the left lane of Queen City Drive, which is not an unusual maneuver in an urban setting.
MD 51/Mechanic Street at Winston Street	WBL	Geometrics are just barely inadequate for trucks to execute the turn. By cutting back the nose of the median on the south side of the intersection, trucks can execute the turn. If C.1 diversion plan is implemented, modifications to the median should be made.
	WBR	Trucks can only execute this turn by swinging wide into the left lane of Winston Street, which is not an unusual maneuver in an urban setting
Harrison Street at Mechanic Street	WBL	Trucks are barely able to execute this turn with current striping. Setting back the northbound stop line would provide additional margin for error.

D. Intersection Operation Issues

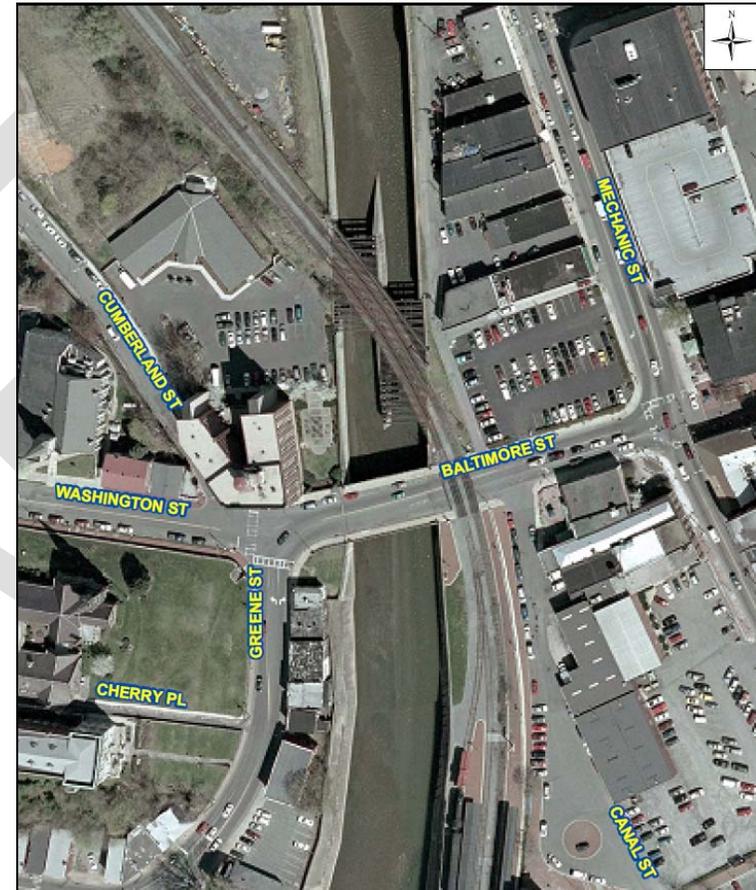

1. Baltimore Street at Mechanic Street

a. Problem

The intersection of Baltimore Street at Mechanic Street is a T-intersection with Baltimore Street terminating at Mechanic Street. Northbound Mechanic Street consists of a shared left-turn/thru lane, southbound Mechanic Street consists of a thru lane and a right-turn lane, and eastbound Mechanic Street consists of a left-turn lane and a right-turn lane. Baltimore Street is a pedestrian plaza east of the intersection. This intersection has significant pedestrian traffic, including 33 pedestrians crossing the intersection during the AM peak hour, and 32 pedestrians crossing during the PM peak hour, as measured during counts conducted on Wednesday, December 16, 2009. The intersection is controlled by a traffic signal, with exclusive/permissive left turn phasing along the northbound Mechanic Street approach, permissive/overlap right-turn phasing along the southbound Mechanic Street approach, and a push-button actuated exclusive pedestrian phase. Right turns on red are permitted along the eastbound Baltimore Street approach. The layout of this intersection as well as the nearby intersections of Baltimore Street at Canal Street and Baltimore Street/Washington Street at Cumberland Street/Greene Street is shown in Figure 10. The intersections of Baltimore Street at Canal Street and Baltimore Street/Washington Street at Cumberland Street/Greene Street are analyzed in their respective sections of this report.

A lunchtime survey of pedestrian activity was conducted from 11:55 AM to 12:15 PM on Tuesday, October 20, 2009, as lunchtime is a period of heavy pedestrian traffic. During this 20-minute period, a total of 37 pedestrians crossed at the intersection, 6 pedestrians crossed near the intersection, and 5 walked across the pedestrian plaza along the east side of the intersection. Of the 37 pedestrians that crossed at the intersection, 20 did so during the exclusive pedestrian phase. 17 pedestrians did not wait for the pedestrian phase and instead crossed when they saw an adequate gap in vehicular traffic.

FIGURE 10 – BALTIMORE STREET AT MECHANIC STREET AND NEARBY INTERSECTIONS

This intersection experiences significant queuing along northbound Baltimore Street due to heavy left-turning traffic along this approach, including 137 turns during the AM peak hour and 222 turns during the PM peak hour. Vehicles that do not clear during the exclusive left-turn phase receive few gaps in southbound traffic during the permissive phase, and typically have to wait until the end of the permissive phase to clear the intersection. As a result, several vehicles must wait through the red phase and then clear the intersection during the following left-turn phase. As the northbound approach is a single-lane approach with a narrow shoulder, northbound thru vehicles are unable to bypass left-turning vehicles. As there are buildings along both sides of the roadway, widening the roadway would be a less-than-desirable option.

Eastbound Mechanic Street left-turn queues are significant during the PM peak hour, and frequently extend beyond the railroad tracks west of Canal Street, as shown in Figure 11. During a survey of queuing at this intersection from 4:00 to 5:00 PM on Wednesday, October 21, 2009, there were 14 instances in which queues developed in the left lane that extended beyond the railroad tracks. During this period, there were 8 instances of cars stopped on the railroad tracks, creating a potential safety issue. 4 of the 14 queues extended to the intersection of Baltimore Street/Washington Street at Cumberland Street/Greene Street, blocking traffic at this intersection. Additionally, there was one queue of right-turning vehicles that extended beyond the railroad tracks, which included a vehicle that stopped on the tracks. No trains traveled across Baltimore Street during this observation period.

Table 8 provides a summary of existing peak hour conditions at the Baltimore Street at Mechanic Street intersection. Detailed SimTraffic output can be found in Appendix E. This intersection, the Baltimore Street at Canal Street intersection, and the Baltimore Street/Washington Street at Cumberland Street/Greene Street intersection are all closely spaced. The operations of these three intersections are related to each other due to their proximity, and were therefore analyzed as a single network in SimTraffic. Analyses of the other two intersections in this network can be found in their respective sections of this report.

**FIGURE 11 – HEAVY WESTBOUND QUEUES
DURING THE PM PEAK HOUR**

**TABLE 8 – SIMTRAFFIC ANALYSIS SUMMARY
BALTIMORE STREET AT MECHANIC STREET – EXISTING CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Baltimore Street	17.0	B	150	25.9	C	218
NB Mechanic Street	42.0	D	215	53.0	D	351
SB Mechanic Street	15.6	B	228	13.5	B	261
Intersection Summary	21.7	C	--	26.8	C	--

b. Potential Solution

The intersection was analyzed with the proposed condition of removal of the pedestrian phase. Under this scenario, pedestrians would cross the intersection during the same phases as vehicular traffic. The overlap phase for southbound Mechanic Street right turns would be removed to allow pedestrians to cross Mechanic Street during the Baltimore Street phase. A summary of proposed conditions at this intersection can be found in Table 9, and detailed SimTraffic output can be found in Appendix E.

**TABLE 9 – SIMTRAFFIC ANALYSIS SUMMARY
BALTIMORE STREET AT MECHANIC STREET – REMOVAL OF EXCLUSIVE PEDESTRIAN PHASE**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Baltimore Street	7.5	A	95	10.4	B	136
NB Mechanic Street	19.0	B	119	37.0	D	265
SB Mechanic Street	10.9	B	161	10.6	B	196
Intersection Summary	11.3	B	--	16.4	B	--

c. Recommendation

Remove the pedestrian phase and allow pedestrians to cross the roadway during vehicular phases. Investigate coordination of this signal with the nearby signals at the intersections of Mechanic Street at Bedford Street and Mechanic Street at Harrison Street.

2. Baltimore Street at Canal Street**a. Problem**

The intersection of Baltimore Street at Canal Street is located approximately 150 feet west of the intersection of Baltimore Street at Mechanic Street, and approximately 250 feet east of the intersection of Baltimore Street/Washington Street at Cumberland Street/Greene Street. Stop control is present along the Canal Street approaches. Additionally, there is a pedestrian-actuated flashing signal for the Great Allegheny Passage Trail at this intersection that directs vehicles to stop as pedestrians cross Baltimore Street. Drivers obey this signal and stop for crossing pedestrians when the signal is flashing. All approaches consist of a single lane; however, eastbound Baltimore Street consists of two lanes just east of this intersection, and the eastbound approach, while striped for one lane, is wide enough to accommodate two lanes of vehicles. These two lanes serve as the left-turn lane and right-turn lane at the Baltimore Street at Mechanic Street intersection. This intersection is adjacent to railroad tracks. Vehicles typically slow down approaching these tracks due to the steep grade along both sides of these railroad tracks. The layout of this intersection is shown in Figure 10 above.

During AM peak hour observations on Wednesday, October 21, 2009, delay for all vehicles was minimal due to low traffic volumes. Turning volumes are particularly low. During the traffic count performed on Thursday, December 17, 2009, only one vehicle arrived at the intersection along the parking lot north of the intersection, and six vehicles arrived at the intersection along NB Canal Street.

Traffic is heavier during the PM peak hour. During the traffic count performed on Thursday, December 17, 2009, 19 vehicles arrived at the intersection along southbound Canal Street, and 12 vehicles arrived at the intersection along northbound Canal Street. The intersection is frequently blocked due to queuing along the Baltimore Street approach at the intersection of Baltimore Street at Mechanic Street.

While turning volumes are low (13 AM/1 PM westbound lefts and 12 AM/2 PM eastbound lefts), these vehicles sometimes have to wait a while for adequate gaps to turn, blocking traffic. Westbound left turns are of particular concern, as the queues that develop behind the turning vehicles can extend beyond the intersection of Baltimore Street at Mechanic Street, blocking vehicles along Mechanic Street from turning onto Baltimore Street.

Table 10 provides a summary of existing peak hour conditions at the Baltimore Street at Canal Street intersection. Detailed SimTraffic output can be found in Appendix E.

**TABLE 10 – SIMTRAFFIC ANALYSIS SUMMARY
BALTIMORE STREET AT CANAL STREET – EXISTING CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Baltimore Street	1.2	A	20	2.2	A	56
WB Baltimore Street	0.8	A	24	1.1	A	43
NB Canal Street	5.1	A	27	10.0	B	34
SB Canal Street	0.0	A	6	5.5	A	39
Intersection Summary	1.1	A	--	1.9	A	--

b. Potential Solutions

With the proposed revisions to signal timing at the nearby intersection of Baltimore Street at Mechanic Street, the queues along Baltimore Street will not extend to the Baltimore Street at Canal Street intersection. A summary of operations at the Baltimore Street at Canal Street intersection can be found in Table 11, and detailed SimTraffic output can be found in Appendix E.

Restricting westbound left turns would eliminate the instances of westbound queues extending to the intersection of Baltimore Street at Mechanic Street; however, this would block vehicles from the east from using the only publicly-owned entrance to Canal Street. Vehicles could enter Canal Street from the south, but would have to travel through a private parking lot, via Harrison Street, to do so.

c. Recommendation

The signal timing improvements at the nearby intersection of Baltimore Street at Mechanic Street will result in improvements at this intersection. Consult with local business owners about possibly restricting westbound left turns and requiring drivers to access Canal Street from the south, which would require installation of signs showing the left turn restriction.

**TABLE 11 – SIMTRAFFIC ANALYSIS SUMMARY
BALTIMORE STREET AT CANAL STREET – PROPOSED CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Baltimore Street	1.3	A	21	1.5	A	21
WB Baltimore Street	0.8	A	19	0.9	A	29
NB Canal Street	5.8	A	21	8.3	A	31
SB Canal Street	0.0	A	6	4.9	A	39
Intersection Summary	1.1	A	--	1.4	A	--

3. Baltimore Street/Washington Street at Cumberland Street/Greene Street

a. Problem

The intersection of Baltimore Street/Washington Street at Cumberland Street/Greene Street is a stop-controlled intersection with stop control along the eastbound Washington Street and southbound Cumberland Street approaches. This is in conflict with the Manual on Uniform Traffic Control Devices (MUTCD), which states, “STOP signs and YIELD signs shall not be installed on different approaches to the same unsignalized intersection if those approaches conflict with or oppose each other.” The westbound Baltimore Street and northbound Greene Street approaches are free movements. The heaviest movements are northbound right turns (310 AM/407 PM) and westbound left turns (164 AM/317 PM). All other vehicular movements experience peak hour volumes of 61 vehicles per hour or less. Three of the four approaches are single-lane approaches, with the exception of the northbound Greene Street approach, which has a separate right-turn lane. The layout of this intersection is shown in Figure 10 above. Trucks sometimes travel westbound along Baltimore Street through the intersection of Baltimore Street/Washington Street at Cumberland Street/Greene Street and continue westbound along Washington Street (in violation of a signed truck restriction), when the preferred route is to turn left onto Greene Street. Table 12 provides a summary of existing peak hour conditions at the Baltimore Street/Washington Street at Cumberland Street/Greene Street intersection. Detailed SimTraffic output is located in Appendix E.

**TABLE 12 – SIMTRAFFIC ANALYSIS SUMMARY
BALTIMORE STREET/WASHINGTON STREET AT CUMBERLAND STREET/
GREENE STREET – EXISTING CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Washington Street	9.1	A	19	17.4	C	50
WB Baltimore Street	0.6	A	7	0.7	A	9
NB Greene Street	2.5	A	26	3.6	A	40
SB Cumberland Street	7.4	A	38	13.6	B	54
Intersection Summary	2.5	A	--	4.2	A	--

b. Potential Solutions

To prevent trucks from traveling west through this intersection from Baltimore Street to Washington Street, the intersection should be altered to make it clear that the primary westbound movement is to turn onto Greene Street. Currently, there are no markings at the intersection that indicate that this movement is the major movement. Installing skipped double yellow striping at the intersection between the Baltimore Street and Greene Street approaches would direct travelers in this direction and reduce confusion at this intersection. In addition, the Greene Street approach would have a STOP sign with an accompanying sign stating “EXCEPT RIGHT TURN” to prevent confusion over right-of-way between Greene Street traffic and Baltimore Street traffic.

It should be noted that no trucks made the westbound thru movement from Baltimore Street to Washington Street during the traffic count conducted on Thursday, December 17, 2009 from 7:00 – 9:00 AM and 4:00 – 6:00 PM. Trucks accounted for 0.4% of all westbound left turns onto Greene Street. While this may indicate that trucks already follow the recommended route through Greene Street during the peak hours, there may be trucks that take the route through Washington Street during off-peak hours.

In addition to the proposed signing and marking improvements, four solutions were analyzed:

- A. All-way stop control
- B. Two-way stop control along Cumberland Street and Greene Street
- C. Roundabout
- D. Traffic signal

The first two options are low-cost improvements that would bring the intersection to meet MUTCD standards and may improve expectancy for drivers unfamiliar with the intersection. Option C, a roundabout, would be a one-lane roundabout with single-lane approaches. Option D, a traffic signal, is unlikely to meet the signal warrants but serves as an example of how signalization would alter intersection operations. The proposed signal would be semi-actuated with permissive phasing along the Baltimore Street and Washington Street approaches and split phasing along the Cumberland Street and Greene Street approaches. Options A, B, and D were analyzed using SimTraffic software, and Option C was analyzed using SIDRA roundabout analysis software. Tables 13A through 12D show the peak hour conditions under the proposed solutions. Detailed SimTraffic and SIDRA output is located in Appendix E.

**TABLE 13A – SIMTRAFFIC ANALYSIS SUMMARY

GREENE STREET – SIGNALIZED INTERSECTION**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Washington Street	4.7	A	12	8.5	A	43
WB Baltimore Street	8.2	A	123	17.1	B	225
NB Greene Street	6.0	A	71	8.0	A	81
SB Cumberland Street	18.6	B	45	15.9	B	59
Intersection Summary	7.4	A	--	12.1	B	--

c. Recommendation

As a short term solution, install skipped double yellow striping at the intersection between the Baltimore Street and Greene Street approaches and install a STOP sign along the Greene Street approach with a sign stating “EXCEPT RIGHT TURN” to prevent confusion over right-of-way between Greene Street traffic and Baltimore Street traffic. Additional discussion is required for how to sign the northbound left turn. There is no standard sign in the MUTCD to cover this movement, which requires northbound left turning drivers to yield to westbound left turning drivers. As a long term solution, examine the feasibility of a roundabout.

4. MD 51 at Queen City Drive/Mechanic Street/Centre Street/Winston Street/I-68 Ramps

a. Problem

This network of intersections consists of two signalized intersections and one stop-controlled intersection, all in close proximity to each other. A diagram of this intersection is shown in Figure 12. This network consists of the three inter-related intersections, listed from west to east:

- I-68 Eastbound Off-Ramp at Winston Street – stop control along I-68 Eastbound Off-Ramp
- Mechanic Street/MD 51 at Winston Street – signalized
- Centre Street/MD 51 at Winston Street/Queen City Drive – signalized

There are three lanes of northbound MD 51, which split into five lanes approximately 350' south of the intersection. Two lanes continue north onto Mechanic Street (with an option to turn left onto Winston Street from the left-most of these lanes), one lane continues north onto Centre Street (with an option to turn left onto Winston Street), and two lanes continue north onto eastbound Queen City Drive via channelized right-turn lanes. This right-turn movement is a free movement. The lane of NB MD 51 that continues onto Centre Street leads to an on-ramp onto I-68 Westbound just north of the intersection. The right lane of Mechanic Street leads to an on-ramp I-68 Eastbound just north of the intersection.

Southbound Mechanic Street consists of two lanes north of Winston Street. At its intersection with Winston Street, Mechanic Street consists of a thru lane and a shared thru/right-turn lane. The thru lanes continue onto southbound MD 51. The I-68 Eastbound Off-Ramp consists of a single-lane southbound approach at Winston Street with a channelized right-turn lane. The thru lane is stop-controlled and continues onto southbound MD 51. The right-turn lane is yield-controlled. Westbound Queen City Drive consists of two lanes. There is a free right-turn movement onto Centre Street, which serves as an added lane on Centre Street. West of Centre Street, Queen City Drive becomes Winston Street, which consists of a left-turn lane onto southbound MD 51 and a thru lane.

FIGURE 12 – MD 51 AT QUEEN CITY DRIVE/
MECHANIC STREET/CENTRE STREET/
WINSTON STREET/I-68 RAMPS

The intersection network operates on two-phase signal operations consisting of a northbound/ southbound phase and a westbound phase. There are no eastbound approaches at this intersection, as the eastbound lanes of Queen City Drive are formed from the channelized right-turn lanes of northbound MD 51. Both signalized intersections operate under the same controller.

Between January 2006 and December 2008, there were 21 reported crashes at this intersection, including 10 rear end crashes. 4 of these rear end crashes occurred on the I-68 Eastbound Off-Ramp. Table 14 provides a summary of crash data at this intersection.

Currently, vehicles traveling northbound wishing to enter Mechanic Street or Centre Street must travel in the left-most lane. Vehicles wishing to turn left onto Winston Street must do the same. Vehicles wishing to turn right onto Queen City Drive may do so from either the center lane or the right lane. As traffic heading to Centre Street is the heaviest movement, this places a large majority of traffic into a single lane (prior to where northbound MD 51 splits into five lanes), causing long queues in this lane. These queues make it difficult for vehicles merging upstream from Canal Parkway to enter this lane, causing weaving issues there.

North of the intersection, Centre Street currently consists of two lanes. The right lane is an added lane from westbound Queen City Drive right turns, which is currently an unrestricted movement. Vehicles making this right-turn movement that wish to enter the left lane of Centre Street must wait for gaps in traffic in the left lane to clear before changing lanes. There is a Wendy's restaurant along the west side of Centre Street that is accessible from Centre Street as well as from Winston Street. The Winston Street entrance is between the two signals. Although patrons traveling westbound along Queen City Drive/Winston Street can access the restaurant by traveling through the first signalized intersection and making an immediate right turn into the parking lot, several drivers choose instead to bypass the signal by turning right onto Centre Street, waiting for traffic to clear in the left lane of Centre Street, then crossing into the left lane of Centre Street to turn left into the Wendy's parking lot. A similar issue arises when vehicles make a right turn from westbound Queen City Drive onto Centre Street to access the I-68 Westbound On-Ramp, although in this case the drivers have a greater distance where they can change lanes.

Existing peak hour conditions were analyzed using SimTraffic software. A summary of peak hour conditions can be found in Table 15. Detailed SimTraffic output is located in Appendix E. As shown, the overall network operates at LOS A during the AM peak hour and LOS B during the PM peak hour.

b. Proposed Solutions

Signal timing adjustments can reduce the long northbound queue lengths. The minimum times for westbound vehicles approaching Centre Street can be decreased to allow more time for northbound vehicles. In the PM peak hour, the cycle length can be reduced from 80 seconds to 60 seconds. Table 16 shows the effects of the optimized timings (see Appendix E for SimTraffic analysis). As shown, overall delay decreases during both peak hours. 95th percentile queue lengths along the lane of northbound MD 51 that leads to Centre Street decrease from 215 feet to 141 feet during the AM peak hour and from 320 feet to 246 feet during the PM peak hour.

During the peak hour observation periods, the I-68 Eastbound Off-Ramp experienced maximum queues of 6 vehicles during the AM peak hour and 8 vehicles during the PM peak hour. Additionally, there may be confusion and a potential safety issue here as these vehicles must stop for northbound lefts and southbound rights at the Mechanic Street/MD 51 at Winston Street intersection. The Manual on Uniform Traffic Control Devices (MUTCD), Section 2B.05, states, "Because the potential for conflicting commands could create driver confusion, STOP signs shall not be installed at intersections where traffic control signals are installed and operating." Installation of a signal at this intersection in place of the existing stop sign would address this issue. The signal would be coordinated with the existing signals at this intersection. By installing a signal here, vehicles would be able to travel through the intersection without stopping during the green phase, and there would be less confusion over right-of-way. The southbound right-turn movement along Mechanic Street, which currently serves 2 vehicles during the AM peak hour and 5 vehicles during the PM peak hour, would be restricted. These drivers could instead access Winston Street by turning left onto Harrison Street north of the intersection, and then turn right onto Queen City Drive and continue through the intersection to Winston Street. This scenario was modeled in SimTraffic, and results are shown in Table 17 below. Detailed SimTraffic output can be found in Appendix E. Overall network delay decreases slightly. Average delay along the I-68 Eastbound Off-Ramp decreases, although 95th percentile queue lengths along this approach increase. These queue lengths (138 feet during the AM peak hour and 180 feet during the PM peak hour) are much shorter than the length of the ramp (approximately 500 feet).

If it is desired to continue to allow vehicles from the I-68 Eastbound Off-Ramp to clear the intersection during the red phase, a green/flashing red signal could be installed for this approach. The signal here would be green when northbound MD 51 and southbound Mechanic Street have the green phase, and would be flashing red when westbound Winston Street and westbound Queen City Drive have the green phase. Such a signal would allow vehicles along this approach to travel through the intersection without stopping during the green phase, and would also allow vehicles to cross the intersection on the red phase after stopping to look for conflicting traffic.

Network Summary	6.5	A	--	11.5	B	--

Cutting off westbound traffic at the intersection of I-68 Eastbound Off-Ramp at Winston Street and making the I-68 Eastbound Off-Ramp a free movement was also examined. Under this scenario, westbound thru vehicles wishing to access Winston Street west of the intersection would be required to turn left onto southbound MD 51 and then make an immediate right, accessing Winston Street via the access point to the south of this intersection. These vehicles would have to enter an approximately 350 foot long weave section with traffic from the I-68 Eastbound Off-Ramp. As this ramp experiences a PM peak hour volume of 537 vehicles, which would allow for few gaps, this is an unadvisable scenario.

While signal retiming helps reduce the queue lengths in the northbound lanes, further geometric improvements would improve intersection operations. Two alternatives were developed in which the northbound MD 51 lane configuration is altered. Under Alternative 1, shown in Figure 13, the left-most lane leads to Mechanic Street, the center lane leads to both Mechanic Street and Centre Street, and the right-most lane leads to both Centre Street and Queen City Drive. This would separate the traffic heading to Mechanic Street and Eastbound I-68 from traffic heading to Centre Street and Westbound I-68. Additionally, both lanes of Centre Street north of Queen City Drive would serve traffic from northbound MD 51, and right-turning vehicles from westbound Queen City Drive would be required to stop before turning onto Centre Street, thus allowing these vehicles to immediately enter their desired lane upon turning.

This scenario was modeled in SimTraffic. Results can be found in Table 18, and detailed SimTraffic output can be found in Appendix E. As shown, results do not differ significantly from those detailed in Table 17. During the PM peak hour, the northbound MD 51 95th percentile queue length at the Centre Street/MD 51 at Winston Street/Queen City Drive intersection decreases from 320 feet under existing conditions to 249 feet. This queue develops in the right lane as opposed to the left lane. This layout would make it easier for vehicles to safely enter northbound MD 51 from Canal Parkway, which is addressed in the next section of the report.

FIGURE 13 – ALTERNATIVE 1 LANE CONFIGURATION CHANGES

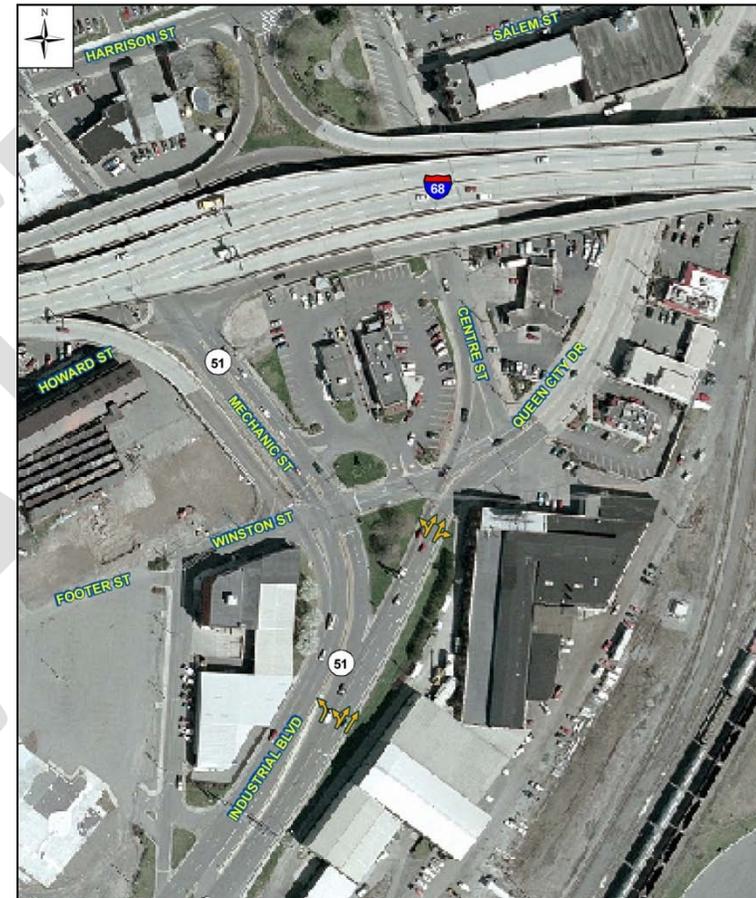

TABLE 18 – SIMTRAFFIC ANALYSIS SUMMARY
MD 51 AT QUEEN CITY DRIVE/MECHANIC STREET/CENTRE STREET/WINSTON STREET/I-68 RAMPS

A second alternative involves changing the northbound lane configurations so that the left lane leads to Mechanic Street and I-68 Eastbound, the center lane would lead to Centre Street and I-68 Westbound, and the right lane would lead to Queen City Drive, as shown in Figure 14. This scenario was modeled in SimTraffic. Results can be found in Table 19 and detailed SimTraffic output can be found in Appendix E. As shown, this configuration provides slightly improved operations compared to the first alternative configuration.

c. Recommendation

As a short term solution, implement the proposed signal timing revisions. As a long term solution, implement Alternative 2, which includes changes to the northbound lane configurations, as well as signalization of the Eastbound I-68 off-ramp. Install new overhead signs to direct traffic into the correct lane. Similar lane configuration alternatives have been explored by SHA. These improvements should be coordinated with any planned SHA projects.

5. MD 51 at Lamont Street

a. Problem

The intersection of MD 51 at Lamont Street is an unsignalized intersection with stop control along the Lamont Street approach and the parking lot/Thomas Street approach. Thomas Street is a lightly-travelled roadway adjacent to a parking lot that intersects with MD 51 across from Lamont Street. Northbound MD 51 consists of a left turn lane, two thru lanes, and a channelized right-turn lane with a deceleration lane. Southbound MD 51 consists of a left turn lane, a thru lane, and a shared thru/right-turn lane. Westbound Lamont Street has a shared left-turn/thru lane and a channelized free right-turn lane with a 500-foot acceleration lane. Eastbound Thomas Street consists of a single-lane approach. The layout of the intersection is shown in Figure 15.

FIGURE 15 – MD 51 AT LAMONT STREET

As expressed at the stakeholder meeting, safety is a concern for vehicles turning from Lamont Street and Thomas Street onto MD 51 due to the high vehicle speeds along MD 51 and lack of adequate sight distance. Sight distance for drivers making a left turn from Lamont Street is 370 feet. Figure 16 shows the restricted sight distance here. Sight distance for drivers making a left turn from Thomas Street is 5.55 feet. According to Exhibit 9-55 of the AASHTO Green Book, the minimum required sight distance for vehicles making a left turn from a stop-controlled approach with a design street of 50 mph along the intersecting roadway is 425 feet. The Lamont Street approach does not meet this requirement. According to the Green Book, if a divided-highway median is wide enough to store the design vehicle with a clearance to the through lanes of approximately 3 feet at both ends of the vehicle, no separate analysis for the departure sight triangle for left turns is needed on the minor-road approach for the near roadway to the left. Vehicles looking to make a thru movement or left turn from the Lamont Street and Thomas Street approaches have to wait for sufficient gaps in traffic along both directions of MD 51 in order to enter the intersection because the median is narrow, and vehicles are therefore unable to cross one direction of MD 51 and then dwell in the median while waiting for an acceptable gap in traffic in the other direction of MD 51. MD 51 has 11-foot-wide left-turn lanes along both directions, with a 7-foot-wide median. This 18-foot-wide area is too narrow an area for vehicles turning from Lamont Street or Thomas Street to safely dwell while waiting for an adequate gap in traffic.

FIGURE 16 – SIGHT DISTANCE RESTRICTION FROM LAMONT STREET

Between January 2006 and December 2008, there were 40 reported crashes at this intersection, including 14 T-type collisions and 14 rear end collisions. Table 20 below provides a summary of crash data at this intersection.

**TABLE 20 – CRASH DATA SUMMARY
MD 51 AT LAMONT STREET**

Crashes	2006	2007	2008	2006-2008	
				Total	Percent

Wet Surface	3	2	1	6	15%
Alcohol Related	0	1	1	2	5%

A radar speed study was conducted along both directions of MD 51 near Lamont Street during off-peak hours on Wednesday, October 21, 2009, in order to assess “free-flow” travel speeds, that is, the speed at which motorists are most comfortable traveling when not impacted by congestion. Results are summarized in Table 21, and detailed speed data can be found in Appendix E. As indicated, during “free-flow” off-peak traffic hours, motorists are traveling at 85th percentile speeds of 51 mph northbound and 46 mph southbound, both above the posted speed limit of 45 mph.

**TABLE 21 – SPEED DATA SUMMARY
MD 51 AT LAMONT STREET**

Criteria	MD 51	
	NB	SB
Posted Speed Limit	45 mph	45 mph
85th Percentile Speed	51 mph	46 mph
% Exceeding Speed Limit	56%	19%
10 mph Pace	42 – 51 mph	37 – 46 mph
Mean Speed	46.3 mph	42.5 mph

SimTraffic analyses were performed during the AM peak hour of 7:15 to 8:15 AM and the PM peak hour of 3:30 to 4:30 PM. Table 22 summarizes the results of SimTraffic analysis. Detailed SimTraffic output can be found in Appendix E. As shown, the intersection currently operates at LOS A during both peak hours.

**TABLE 22 – SIMTRAFFIC ANALYSIS SUMMARY
MD 51 AT LAMONT STREET – EXISTING CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Thomas Street*	0.0	A	0	20.2	C	33
WB Lamont Street	1.6	A	28	2.6	A	38
NB MD 51	0.9	A	6	1.4	A	9
SB MD 51	1.4	A	65	2.9	A	111
Intersection Summary	1.3	A	--	2.4	A	--

*Zero vehicles traveled along the EB Thomas Street approach during the AM peak hour.

b. Proposed Solutions

Widening the median would allow left-turning vehicles along Lamont Street and Thomas Street to safely dwell in the median while waiting for acceptable gaps in traffic. The 12-foot-wide deceleration lane from northbound MD 51 to eastbound Lamont Street and the 12-foot-wide acceleration lane from westbound Lamont Street to northbound MD 51 would be removed, and the two northbound MD 51 lanes would be shifted 12 feet to the east to provide for a 30-foot-wide median. The northbound right-turn lane would be removed, and one of the northbound thru lanes would be converted to a shared thru/right-turn lane. Northbound right-turn channelization would remain. There are currently 42 northbound right turns during the AM peak hour and 23 northbound right turns during the PM peak hour. The westbound channelized right-turn lane would remain, but would be yield-controlled due to the removal of the acceleration lane. SimTraffic analysis was performed under these conditions, and is summarized in Table 23. Detailed SimTraffic output can be found in Appendix E. As shown, the proposed geometry will offer similar peak hour conditions to the existing geometry.

**TABLE 23 – SIMTRAFFIC ANALYSIS SUMMARY
MD 51 AT LAMONT STREET – PROPOSED CONDITIONS**

Approach	AM Peak Hour			PM Peak Hour		
	Delay (s)	LOS	95 th % Queue (ft)	Delay (s)	LOS	95 th % Queue (ft)
EB Thomas Street	0.0	A	0	15.0	B	28
WB Lamont Street	2.0	A	32	2.9	A	33
NB MD 51	0.6	A	6	0.8	A	7
SB MD 51	1.6	A	69	2.7	A	103
Intersection Summary	1.3	A	--	2.2	A	--

Unfortunately, this layout would likely result in additional sight distance issues, and is therefore not recommended. Alternative proposals restricting access are preferred. These proposals include the restriction of left turns and thrus from westbound Lamont Street onto southbound MD 51 and the restriction of left turns from southbound MD 51 to Lamont Street. Vehicles from Lamont Street wishing to access MD 51 to the south may do so by following the local roadway network to Virginia Avenue, which reaches MD 51 via a signalized intersection. Vehicles traveling southbound along MD 51 wishing to access Lamont Street may do so by traveling past Lamont Street and making a u-turn approximately 1,400 feet to the south at the intersection of MD 51 at 2nd Street, then turning right onto Lamont Street. 6 AM/7 PM vehicles make a westbound left turn, and 0 AM/2 PM vehicles make a westbound thru movement. 219 AM/325 PM vehicles make a westbound left turn.

c. Recommendation

Restrict thrus and left turns from Lamont Street, and restrict left turns from southbound MD 51. Install signing directing southbound vehicles to make a u-turn at 2nd Street and then turn right onto Lamont Street. In addition, signing could be installed directing drivers to use 1st Street to access southbound MD 51. Since this section of MD 51 is owned by SHA, improvement options should be coordinated with SHA.

6. MD 51 at Virginia Avenue

a. Problem

MD 51 is a one-way pair in the vicinity of Virginia Avenue. The eastbound and westbound lanes of MD 51 are set approximately 200 feet apart, with houses and businesses between the two sets of lanes. Westbound MD 51 consists of a shared left-turn/thru lane, a thru lane, and an approximately 250-foot-long shared thru/right-turn lane. The center lane and right-most lane of westbound MD 51 merge approximately 1,150 feet downstream of the intersection. Eastbound MD 51 consists of a shared left-turn/thru lane, a thru lane, and a right-turn lane. Northbound Virginia Avenue consists of a single-lane approach at eastbound MD 51, and has a separate 85-foot-long left-turn bay at its approach to westbound MD 51. Southbound Virginia Avenue consists of a single-lane approach at westbound MD 51 and has a separate 50-foot-long left-turn bay at its approach to eastbound MD 51. The layout of MD 51 at Virginia Avenue is shown in Figure 17.

Between January 2006 and December 2008, there were 17 reported crashes at this intersection, all of which resulted in property damage only. Table 24 below provides a summary of crash data at this intersection.

FIGURE 17 – MD 51 AT VIRGINIA AVENUE

MD 51 at Virginia Avenue consists of two signalized intersections that operate as one signal system. Eastbound and westbound thru traffic run concurrently with a leading westbound left-turn/thru phase. Northbound and southbound traffic run on split phasing, with the southbound phase preceding the northbound phase. There is an eight-second clearance phase for southbound Virginia Avenue at eastbound MD 51 that occurs after the eastbound/westbound MD 51 phase and before the eastbound Virginia Avenue phase. The signal is semi-actuated with camera-actuation along the Virginia Avenue approaches. This network experiences long delay times and heavy queues. The network was analyzed using SimTraffic software. A summary of existing operations is shown in Table 25, and detailed SimTraffic output can be found in Appendix E. As shown, the signal system operates at LOS C during the AM peak hour and LOS D during the PM peak hour. The approach with the greatest delay is the southbound Virginia Avenue approach to westbound MD 51, which operates under LOS D during the AM peak hour and LOS E during the PM peak hour.

Queuing was measured along the northbound Virginia Avenue approach to eastbound MD 51 during the PM peak hour on Tuesday, March 2, 2010. The longest observed queue consisted of 28 vehicles. The second-longest queue consisted of 22 vehicles, which is approximately the same as the 95th percentile queue determined in SimTraffic. Most queues were between 11 and 17 vehicles. Each vehicle cleared the intersection on green during 19 of the 20 queues that occurred during this peak hour. The one queue that did not clear contained 22 vehicles, 2 of which did not clear the intersection on green. One of these vehicles was able to turn right on red.

Additionally, there is a tight turning radius for vehicles turning right from eastbound MD 51 onto Virginia Avenue. While the northbound Virginia Avenue stop bar is set back from the intersection in order to provide space for eastbound trucks to turn right, conflicts occur when a northbound right-turning vehicle stops beyond the stop bar. These vehicles do so to look for an adequate gap in eastbound traffic before turning right on red. When a northbound vehicle stops beyond the stop bar, the eastbound right-turning truck must wait for the northbound vehicle to turn while the northbound vehicle waits for an acceptable gap in eastbound thru traffic.

**TABLE 25 – SIMTRAFFIC ANALYSIS SUMMARY
MD 51 AT VIRGINIA AVENUE – EXISTING CONDITIONS**

b. Proposed Solutions

One proposal to improve the intersection involves altering the lane configuration along westbound MD 51 to provide for a separate left-turn lane. Under this configuration, the left-most lane of westbound MD 51 would be converted to a dedicated left-turn lane, and the other two lanes would serve as thru lanes. Under the existing geometry, several thru vehicles travel in the left-most lane along with left-turning vehicles. When the left-turning vehicles queue back from the eastbound MD 51 at Virginia Avenue signal, as shown in Figure 18, the thru vehicles get trapped in this lane, and are often unable to change lanes due to the lack of adequate gaps in traffic in the center lane. By converting the left-most lane to a dedicated left-turn lane, thru vehicles would only travel in dedicated thru lanes and would avoid getting trapped behind left-turning vehicles. Currently, the three westbound lanes merge to two lanes approximately 1,150 feet downstream. If the left-most lane is converted to a dedicated left-turn lane, then westbound MD 51 would consist of two lanes west of Virginia Avenue, and there would be no downstream merge.

Table 26 provides a summary of peak hour operations with the conversion of the left-most lane of westbound MD 51 to a dedicated left-turn lane. Detailed SimTraffic output can be found in Appendix E. As shown, the intersections would operate at slightly improved conditions during the PM peak hour compared to existing conditions. The 95th percentile queue for westbound traffic during the PM peak hour would decrease from 268 feet to 242 feet.

**FIGURE 18 – QUEUES ALONG VIRGINIA AVENUE BLOCK

Intersection Summary	32.3	C	--	37.5	D	--
Signal Network Summary	36.6	D	--	46.1	D	--

Two other issues were also examined. Restricting northbound right turns on red would eliminate the possibility of northbound right-turning vehicles blocking eastbound trucks from turning right, although this would increase average delay and queues along the northbound approach. Currently, 208 vehicles make a northbound right turn during the AM peak hour. 201 vehicles make this movement during the PM peak hour.

The other issue involves signal phasing. Currently, there is an eight-second clearance phase for southbound Virginia Avenue at eastbound MD 51, which occurs after the eastbound/westbound MD 51 phase and before the southbound Virginia Avenue phase. This phase allows vehicles that have made a westbound left turn onto Virginia Avenue to clear eastbound MD 51 before the vehicles along southbound Virginia Avenue start. Overall, this results in the southbound phases having unused green time at the expense of green time for other phases. As there are only 42 AM/65 PM southbound thru vehicles, it is advisable to combine the clearance phase with the southbound Virginia Avenue phase, which would provide a higher percentage of green time for the phases with greater traffic volumes. The cycle length would be reduced from 180 seconds to 160 seconds during both peak hours. Table 27 summarizes

operations with all improvements implemented. Detailed SimTraffic output can be found in Appendix E. As shown, during both peak hours, implementing these improvements will decrease delay at the intersection over the scenario of conversion of the left-most lane of westbound MD 51 to a dedicated left-turn lane.

Finally, the installation of a “Michigan left” was investigated. In a Michigan left, some or all left-turn movements are prohibited, and vehicles wishing to make this movement must instead turn around at a distance away from the intersection. Under this proposal, the westbound lane of Virginia Avenue would be closed between the eastbound and westbound lanes of MD 51. Westbound left turns would continue west along MD 51, make a u-turn at a turnaround lane onto eastbound MD 51, and finally turn right onto Virginia Avenue. Southbound thru and left turns from Virginia Avenue would have to turn right onto westbound Virginia Avenue, use the turnaround lane to reach eastbound MD 51, and finally travel through the intersection of Eastbound MD 51 at Virginia Avenue. Under this layout, the westbound left-turn phase would be eliminated, and northbound and southbound traffic could operate concurrently, allowing the signal to operate on two-phase operations, and reducing the cycle length from 180 seconds to 60 seconds.

There are two proposed locations for the turnaround lane. Option A involves using the existing Springdale Street as a turnaround lane. Under this option, construction of a traffic signal at the intersection of Eastbound MD 51 at Springdale Street would be required as sight distance here may not be adequate for trucks wishing to turn from Springdale Street onto MD 51. Option B involves constructing a new turnaround lane further west. Figures 19A and 19B display the proposed layouts of the two options. Tables 28A and 28B summarize operations under this layout, and detailed SimTraffic output can be found in Appendix E.

Network Summary	14.0	B	--	16.8	B	--

As shown, under both options, delay and queue lengths decrease substantially during both peak hours compared to existing conditions. LOS improves from C to B during the AM peak hour and from D to B during the PM peak hour.

c. Recommendation

Install either of the Michigan Left proposals.

7. McMullen Bridge

a. Problem

The McMullen Bridge is located just north of downtown Cumberland and serves traffic along eastbound Frederick Street and westbound Bedford Street. It crosses over Henderson Avenue, Queen City Drive, and the railroad tracks. A map of the access points to/from the east side of the bridge is shown in Figure 20. The westbound lanes of the bridge are not heavily traveled, due in part to the fact that the bridge is accessed by one-way streets including Bedford Street, Independence Street, and Polk Street. Drivers traveling along Henderson Avenue wishing to access the westbound lanes of the bridge may do so by turning onto eastbound Polk Street, turning left onto Columbia Avenue and then turning right immediately onto eastbound Polk Street, then turning right onto southbound Independence Street, which terminates at the McMullen Bridge.

b. Proposed Solution/Recommendation

There is no signing in this area directing drivers to make these movements. Install signing along Henderson Avenue, Polk Street, Columbia Avenue, and Independence Avenue to direct traffic onto this bridge. This could send more vehicles to this bridge as opposed to other access points to downtown, including the intersections of Front Street at Baltimore Street and Baltimore Street at Queen City Drive.

FIGURE 20 –MCMULLEN BRIDGE AND NEARBY ROADWAYS

E. Vehicle Weaving Conflict

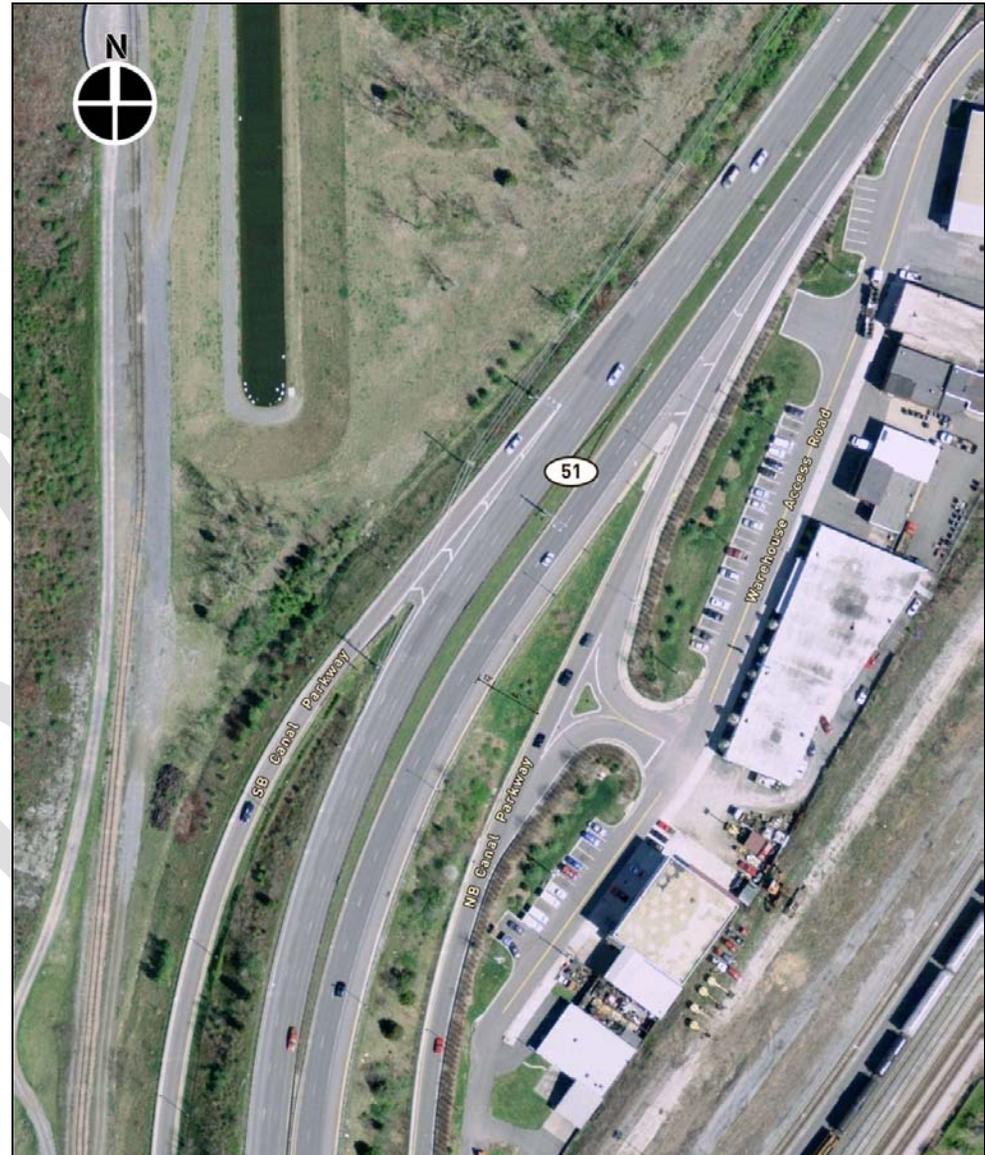

1. MD 51 Northbound at Canal Parkway Northbound Weave

a. Problem

The section of northbound MD 51 (Industrial Boulevard) between the ramp from northbound Canal Parkway and the signalized intersection of MD 51 with Queen City Drive, Mechanic Street, Centre Street, Winston Street, and the I-68 Ramps currently operates as a weave section. The weave area of northbound MD 51 and the ramp from northbound Canal Parkway is shown in Figure 21. Northbound MD 51 consists of three lanes in this area. At the south end of this section, there are two lanes along MD 51, and the third lane is added on the right from northbound Canal Parkway. At the north end of this section, the left lane leads to northbound Centre Street, northbound Mechanic Street, and the I-68 Ramps, with an option to turn left onto Winston Street. The center and right lanes lead to eastbound Queen City Drive.

Vehicles traveling from northbound Canal Parkway must perform two lane changes in an approximately 650-foot-long segment to enter the lane of northbound MD 51 that leads to Centre Street, Mechanic Street, and the I-68 Ramps. Due to the relatively low traffic volumes, conflicts here are infrequent. AM and PM peak hour observations were conducted on October 22, 2009. During the AM peak hour, there were three instances in which vehicles from Canal Parkway wishing to merge into the left-most lane of MD 51 had to slow down in order to merge into that lane. During the PM peak hour,

FIGURE 21 – NORTHBOUND MD 51 WEAVE SECTION

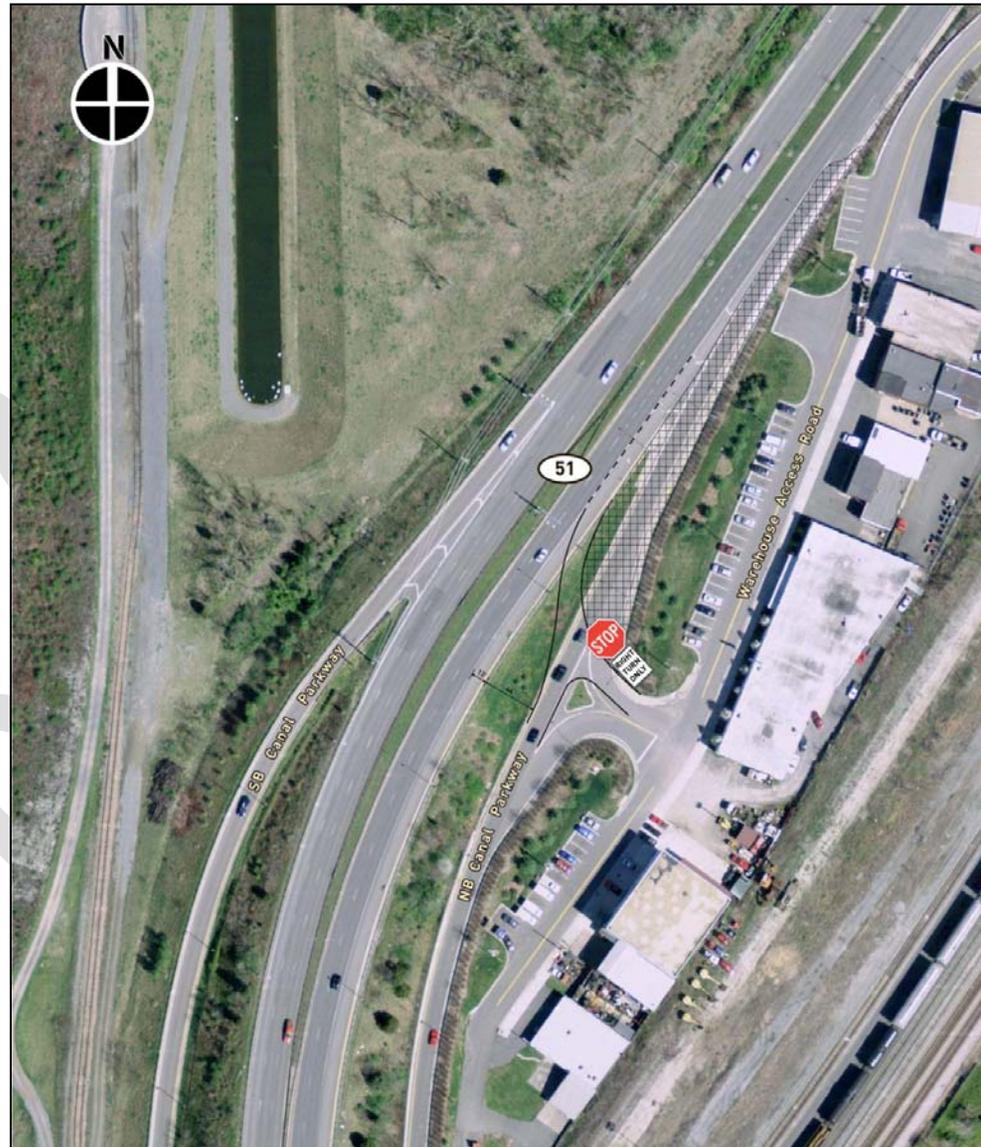

there was one instance of a conflict caused by a long queue in the left lane at the intersection of MD 51 at Queen City Drive, Mechanic Street, Centre Street, Winston Street, and the I-68 Ramps. In this instance, a vehicle entering MD 51 from Canal Parkway waited in the Canal Parkway ramp while waiting for the queue in the left lane to clear, causing a queue to form in the Canal Parkway ramp.

b. Potential Solutions

To minimize weaving, it is proposed that Canal Parkway merge with MD 51 prior to the beginning of the third lane, as shown in Figure 22. Canal Parkway would merge with MD 51, and the third lane would open downstream. This would allow Canal Parkway traffic to merge with MD 51 traffic prior to when MD 51 traffic would attempt to enter the right-most lane. The right-out access would be replaced with a stop-controlled access point for vehicles along the warehouse access road wishing to access MD 51 in this area. This scenario may not be feasible due to the grade separation between MD 51 and Canal Parkway.

Another way to address the weaving issue is to change the lane configurations of MD 51 downstream at the intersection of MD 51 at Queen City Drive/Mechanic Street/Centre Street/Winston Street/I-68 Ramps, as described in the previous section of this report. Under both Alternative 1 and Alternative 2, most drivers would be required to make fewer lane changes, and the queue lengths will be shorter, allowing a greater distance in which drivers may enter their desired lane.

FIGURE 22 – PROPOSED IMPROVEMENTS TO
NORTHBOUND MD 51 WEAVE SECTION

c. Recommendation

Make no changes to the existing geometry at this location. The improvements at the intersection of MD 51 at Queen City Drive/Mechanic Street/Centre Street/Winston Street/I-68 Ramps will result in less weaving as well as a longer area in which vehicles can change lanes.

IV. Project Action Plan

A summary of the recommended improvements is provided in the Project Action Plan in Table 29 below.

Table 29. Project Action Plan

Issue #	Location	Description
<i>Signing and Marking Improvements</i>		
B	Citywide	Begin phased program of modernizing street name signs; begin discussion with SHA about developing a coordinated tourism signing program;
C.2	Mechanic Street at Queen City Drive (north side)	Install signs along Mechanic Street restricting all trucks over ¾ ton, except local deliveries, beyond Queen City Drive; repaint the southbound Mechanic Street approach to remove the separate left-turn lane; relocate the westbound lane of Queen City Drive to the north.
D.2	Baltimore Street at Canal Street	Consult with local business owners about restricting westbound left turns and requiring drivers to access Canal Street from the south, which would require installation of signs showing the left turn restriction.
C.3/D.3	Baltimore Street/Washington Street at Cumberland Street/Greene Street	As a short term solution, install skipped double yellow striping at the intersection between the Baltimore Street and Greene Street approaches and install a STOP sign along the Greene Street approach with a sign stating “EXCEPT RIGHT TURN”. To discourage trucks from driving on Washington Street, add the regulatory message “NO TRUCKS” below the guide message on westbound Baltimore Street and install a standard I-68 sign assembly on the same approach.
D.7	McMullen Bridge	Install signing along Henderson Avenue, Polk Street, Columbia Avenue, and Independence Avenue to direct traffic onto the bridge.
<i>Signalization Improvements</i>		
A	Citywide	Conduct detailed study of the cost of modernizing and retiming traffic signals Citywide. Acquire funding for phased implementation of the modernization plan.

Issue #	Location	Description
D.1	Baltimore Street at Mechanic Street	Remove the pedestrian phase and allow pedestrians to cross the roadway during vehicular phases; investigate coordination of this signal with the nearby signals at the intersections of Mechanic Street at Bedford Street and Mechanic Street at Harrison Street.
D.4	MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps	As a short term solution, implement the proposed signal timing revisions.
<i>Geometric Improvements</i>		
D.3	Baltimore Street/Washington Street at Cumberland Street/Greene Street	As a long term solution, examine the feasibility of a roundabout.
D.4	MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps	As a long term solution, implement Alternative 2, which includes changes to the northbound lane configurations, as well as signalization of the Eastbound I-68 off-ramp. Install new overhead signs to direct traffic into the correct lane.
D.5	MD 51 at Lamont Street	Restrict thru and left turns from Lamont Street, and restrict left turns from southbound MD 51. Install signing directing southbound vehicles to make a u-turn at 2 nd Street and then turn right onto Lamont Street.
D.6	MD 51 at Virginia Avenue	Install either of the Michigan Left proposals.
<i>Improvements from Related Issues</i>		
D.2	Baltimore Street at Canal Street	The signal timing improvements at the nearby intersection of Baltimore Street at Mechanic Street will improve operations at this intersection.
E.1	MD 51 NB at Canal Parkway NB Weave	Implementation of the solutions at the intersection of MD 51 at Queen City Drive/ Mechanic Street/Centre Street/ Winston Street/I-68 Ramps will improve operations in this area.

Brenda Smith	City of Cumberland	brendasmith@allconet.org

Prepared by: Tom Hannan, WR&A

MEMORANDUM OF MEETING

- Tom Hannan gave an introduction of the project to the Stakeholders. John DiFonzo approached WR&A to do a transportation study using County funds. In summary, WR&A had previously worked with John DiFonzo on the Ridgely, WV truck signing project. WR&A was brought on board due to the success of that project coupled with the need to address other issues in the City. John DiFonzo thanked the group for their participation.
- The role of stakeholders is to help the project team (City and WR&A) identify problems in the City and to help prioritize solutions. The stakeholders can provide local knowledge and advise the project team on potential improvement alternatives. Stakeholder input during the process will also give study recommendations more weight when funding decisions are being considered.
 - There are several components to the study, outlined below. John emphasized that some projects may have expensive solutions; however, the goal would be to focus on low cost solutions.
 - Truck Routing/Signing – major component. City is broken up by water, rail, roads; not well defined as a grid network; out of towners/tourists need guide signing.
 - Geometric Features Inventory/Assessment – roadway geometry, curb radii, etc.
 - Traffic Operations Assessment
 - Device inventory (signals, signs, markings)
 - Crash data review – no major problems in City compared to statewide averages; stakeholders may be aware of unreported property damage crashes, which do not show up in SHA's records.
 - Data collection efforts will include conducting one week field study, outlined below. The project was scoped as a moderately budgeted project, which did not allow for a more exhaustive and expensive origin and destination study. WR&A will make use of City conducted traffic counts wherever possible.
 - Signing inventory
 - Tourist survey
 - Train station license plate survey – where are people coming from/to
 - Trucking industry survey of trucking industry reps – has been done in other areas; good information provided about problems/uses along their routes.
- Jeremy Mocny began the brainstorming discussion by reviewing several issues that John emailed to WR&A at the beginning of the study. The issues are listed below generally in the order of the discussion. *See attached for original list of issues.*
 - Lt. Leake – Truck drivers continue to get lost along the truck detour route on west side of town, *which is in place due to a restricted vertical clearance railroad overpass on Greene Strett. The Allegany*

Street leg along the truck detour route is a problem. In addition, there have been complaints of trucks getting lost and stuck on Washington Street. Based on field observations prior to the meeting, signs are missing along the Greene Street truck detour. Need: “← Truck Route” on northbound Allegany Street followed by “End Detour” sign on westbound Greene Street. Harold Hipsley agreed to follow-up on this. *WR&A will investigate the truck detour route as part of the study.*

- Baltimore and Mechanic – people push button and then cross on “Don’t Walk” phase; signal changes and no pedestrians present, causing unnecessary delay; “Barnes Dance” operation. WR&A recommend adding standard pedestrian instructional sign.
- Allegany and Greene – “Barnes Dance” with Police Officer near elementary school
- Harold Hipsley – Coal trucks – 6 to 12 round trips per day; 1-15 trucks per day; origin is Berlin.
- Einer Johnson – Trucks could use Queen City Drive, but intersection of Queen City Drive and Mechanic can not be negotiated. Buses can negotiate the turn. Dave Umling mentioned that bike study looked at geometry.
- Lt. Leake – *At times during the lunch hour trucks may occupy an entire block in the downtown area.*
- Terri Bennett – Truck noise a problem for downtown businesses
- Harold Hipsley – Both Queen City Drive/Mechanic and Queen City Drive/Centre turns to MD 51 South have geometry problems for tractor trailers.
- Problem intersection of Queen City Drive and I-68 EB exit (Exit No. 43C). There are sight distance restrictions at the intersection *due to the location of a bridge pier*, as well as at the Citgo and Roy Rogers. *I-68 was constructed first, and that when Queen City Drive was constructed the geometry of the roadway had to work with the existing bridge pier locations, resulting in the sight restrictions observed today.* Queen City Drive is City-owned; MD 51 is state-owned. ~~*Stephen Bucy (SHA District 6 Traffic Representative for George Small) mentioned that SHA has done studies of this intersection.*~~
- Another problem intersection is MD 51 (Industrial Boulevard) and Virginia Avenue. Southbound right turns from MD 51 have difficulty making turns when northbound Virginia Avenue vehicles pull beyond the stop line; potentially prohibiting right-turns on red. SHA-maintained signal with long cycle length is a problem today. *Stephen Bucy (SHA District 6 Traffic Representative for George Small) mentioned that SHA has done studies of this intersection*, and implemented improvements over the years.
- Lt. Leake mentioned that Virginia Avenue is the only access point from Canal Parkway, which can lead to westbound left turn problems due to short spacing between signals.
- Field work should be accelerated to avoid temporary one-way pattern from September 2009 to 2010; resurfacing/curb/sidewalk; Lamont Street to Boulevard. ~~*Steve Bucy mentioned that patterns could change with the new hospital, Steve will provide TIS.*~~ The one-way operation is being evaluated by the City as a permanent change.
- *Stephen Bucy mentioned that travel patterns on the East Side of town could change with the opening of the new hospital; Stephen will provide TIS.*
- Harrison/Mechanic Street: westbound Harrison to southbound Mechanic, trucks can not make left turn.

- Einer Johnson – All signals operate isolated; he recommends linking Bedford, Baltimore, Harrison, Mechanic together and adding fire house pre-emption; no Opticom today. Interconnect cable is present in the handboxes, but there is not enough slack to connect the intersections; all intersections currently operate on fixed time operation, other problems: power outage creates problems; no detectors.
- Several issues were raised regarding the Canal Street and Baltimore Street intersection:
 - The first issue was a traffic operations issue related to stacking across this intersection from the west leg of the Baltimore/Mechanic Street intersection. One recommendation was to prohibit westbound Baltimore Street left turns onto southbound Canal Street. Another complaint voiced is that news trucks take up a lot of space in this block. *In addition to the current operational issues, future traffic problems could be added by a new Fairfield Inn planned for this area, with up to two restaurants proposed.*
 - The second issue dealt with the Great Allegheny Passage Trail crossing of Baltimore Street, which is located just west of the intersection with Canal Street. Einer Johnson mentioned that bikers don't understand the crossing operation and the intent of the warning lights. Terri Bennett mentioned that trail organization is working on signing that will instruct peds/bicyclists to use the flashing lights. John DiFonzo mentioned that a bike detector there may not be working; it was put in by Allegany County. Lt. Leake mentioned planned educational sessions to include distributing pamphlets about crossings. For now, the trail crossing will not be studied further as part of this study.
- ~~*On southbound Mechanic Street, left turns are prohibited at Pershing and Harrison. Potential solution: convert Mechanic Street to one-way northbound.*~~
- ~~*Comment was made about the difficulty of trucks making left turns at the Mechanic Street at Pershing Street and Harrison Street intersections. One solution proposed for this section was to convert it to one-way southbound.*~~
- Lt. Leake – Lamont Street at MD 51 (Industrial Boulevard) intersection has high velocity crash problems due to poor sight distance. Left turns from westbound Lamont to southbound MD 51 have to cross three lanes of northbound traffic to enter median opening.
- Question: Will the study address pedestrians/bicyclists issues? John DiFonzo will have WR&A coordinate with on-going bike trail and downtown studies and will coordinate traffic signing efforts. This study will primarily focus on truck/general routing, not tourism/ped/bike.
- Question: How will planning for US 220 upgrade to connect to Corridor H be integrated into this study? Dave Umling responded that alignments have not been set. John DiFonzo reiterated that consideration of Corridor H will not be part of this study.
- Harold Hipsley – Handicap parking permit holders have overwhelmed the use of on-street parking spaces.
- Albert Keener – It is easier to *make right turns from side street/entrances to go* south on Queen City Drive than *it is to make left turns from side street/entrances to go* north. This may be related to signal timing preferences. WR&A will investigate this issue further to determine the issues and possible options to recommend for improvement.
- Trucking related issues and comments included:

- Ed Miller – Cumberland would be the fourth town to study truck routing. Baltimore recently completed a study; New York has a very detailed truck routing map on their website. Use of the “jake brake” can not be prohibited; however, signs stating “Modified Exhaust Systems Prohibited” is an option.
- John DiFonzo – Deliveries to many businesses are now made by large trucks due to the ‘on-time delivery’ approach to shipping.
- Bill Gray – Local trucking companies to contact: Pitt-Ohio, UPS Freight. Two companies have truck-specific GPS units: Cobra, Hendricks; providing them with truck route mapping would be a good way of reducing truck traffic on local streets.
- William Herbaugh and Kim Twigg – Northbound Canal Parkway “on-ramp” at MD 51 (Industrial Boulevard) – have weaving problems. *In addition to the current operational issues, future traffic problems could be added by a new Fairfield Inn planned for this area, with up to two restaurants proposed.*
- Teri Bennett – Maryland/Virginia/Oldtown intersection has an issue with trucks turning onto Virginia; vehicles can’t make left turn onto Maryland from Virginia per Albert Keener.
- Next meeting: December ~~8th~~ *9th*, which is the same day as the Allegany County Transportation Adv. Committee (Police, Maintenance, and Emergency personnel). *Invitations will be sent out prior to the meeting with time and location.*

Any participant wishing to amend the minutes is requested to notify the writer within seven (7) days.

Enclosures

Tom,

This reminded me that I have not sent you some information I came across. It is not as big as I thought, so I am just attaching it to this email.

In addition to that I wanted to mention a few others areas that I would like to see addressed in the study. They are as follows:

1. There are CSX Bridges with restricted weight limits on Cumberland Street, Fayette Street and Washington Street.
2. That same track goes over Greene Street and it has a clearance of only 12' 10". Trucks are detoured onto a "Truck Route" which goes over the tracks (Allegany Street, Beall Street, and S. Lee Street) and the signing (or lack of good signing) may contribute to trucks getting onto streets they don't belong on.
3. Washington Street is a residential street in the historic area of town, and we have received complaints about trucks that appear to be lost traveling on Washington Street. It may be possible that No. 2 contributes to this problem, but I am not sure.
4. I have received a complaint about the need for a pedestrian light at S. Mechanic Street and Harrison Street, because of the number of cars that park near the train station or under I 68 and then walk to their jobs in the morning and afternoon. (I understand this one may be out of the scope, but I thought I would mention it anyway.)
5. We have received a request for a sign indicating that trucks are not allowed on Decatur Street, because they turn from Baltimore Avenue then can make the turn onto Fredrick Street at Decatur Street. The only problem I see with this request is that the intersection of Decatur Street and Frederick Street is like just about every intersection in Cumberland.
6. Signs on the McMullen Bridge facing Fredrick Street at Centre Street direct travelers to Route 220 North, but Rte. 40 and Rte. 220 were directed to and made part of I 68 years ago.
7. We have some screwy lane markings on Greene Street east of Allegany Street in an attempt to allow a left turn lane onto Allegany Street from Greene Street. The same kind of left hand turn lane exists on Park Street at the Post Office. I think we know the answer, but it would be good to have a recommendation. I think we will need to eliminate a few parking spaces in both cases, and trying to keep this is what appears to be causing the problems.
8. One of the primary complaints that we received and may have been the start of the need for this study is the coal truck traffic that sometimes uses Mechanic Street to connect to Route 51. AES, a power plant in Mexico Farms gets most of its coal from I-68 to Industrial Blvd. (Rt. 51) however we understand that some of the trucks come from Rte. 36. The shortest route from Rt. 36 to Rt. 51 S is Mechanic Street.
9. A lot of truck traffic uses Virginia Avenue and that means they have to go under the CSX tracks near the CSX Yard. The road was lowered so that trucks no longer get stuck in the "sub-way" but the turns are a little hard to make for trucks. Don't think this one can be solved, but
10. Our Historic Signs are old and faded and need to be replaced.
11. The Downtown area does have some new informational signs, but even they need to be painted.

I am sure there are other places but wanted to make sure these received at least a good look during this study.

Thanks,
John

MEMORANDUM OF MEETING

Date: March 15, 2010

Date of Meeting: March 8, 2010

Time: 10:00 AM

Location: Cumberland, MD

Project: Cumberland Traffic Study
WR&A W.O.: 31722-001

Attendees:	John DiFonzo	City of Cumberland	jdifonzo@allconet.org
	John Chapman	City of Cumberland	jchapman@allconet.org
	David Umling	City of Cumberland	dumling@allconet.org
	Kim Root	City of Cumberland	kimtwigg@allconet.org
	Harold Hipsley	City of Cumberland	hhipsley@allconet.org
	Greg Leake	Cumberland Police	gmleake@allconet.org
	Einer Johnson	Citizen	N/A
	Stephen Bucy	SHA	SBucy@sha.state.md.us
	Siera Wigfield	Allegany County	Siera.Wigfield@allconet.org
	Tom Hannan	WR&A	thannan@wrallp.com
	Jeremy Mocny	WR&A	jmocny@wrallp.com
	Evan Hershman	WR&A	ehershman@wrallp.com

The purpose of this meeting was to discuss WR&A's preliminary findings and recommendations. The following issues were discussed:

- Issue #1: Trucks on Mechanic Street in Downtown
 - Options for detouring trucks around downtown were presented, Option B – the Queen City Drive route is the recommended option. Existing travel times through downtown need to be shown for comparison.
 - Left turn for trucks from WB Winston Street to SB Industrial Boulevard is problematic and may render the Mechanic Street to Industrial Boulevard truck detour impractical.
 - Trucks destined for I-68 need to be considered. WR&A will conduct a license plate study along Mechanic Street to determine what percent of trucks are destined for I-68 (left turns at Harrison Street) versus Industrial Boulevard.
 - The Downtown Development Committee has been one of the driving forces for getting trucks off Mechanic Street. Their primary concerns are that trucks block intersections and rut the street. This should be sufficient rationale for diverting trucks onto the alternative route. Once the license plate study is complete a meeting will be scheduled

- with the MD Motor Trucking Association and coal trucking companies in Pennsylvania to discuss the detour option(s).
- Einer is working on a solution for the flashing operation at the Baltimore/Queen City intersection; when the track preemption circuit is triggered, it will place the signal in flashing operation. WR&A will assess the effect of train preemption on the Mechanic Street to Queen City Drive truck diversion route
 - Issue #2:
 - An option was presented that restriped the southbound Mechanic Street approach to the intersection to provide only one shared left-thru lane to allow all vehicles to pass under the center of the restricted vertical clearance railroad arch, and removed parking on the westbound Queen City Drive approach to shift the travel lane north. The restriping on Mechanic Street may provide parking opportunities to offset the parking lost on Queen City Drive.
 - Continuous parking on east side of Mechanic Street approaching Queen City Drive is not feasible due to the presence of private driveways along this side of the roadway. WR&A will assess how many spaces can be created and whether the number of spaces lost on Queen City Drive by shifting the travel lane can be offset by adding parking on Mechanic Street.
 - Issue #3: Baltimore Street at Mechanic Street
 - The Baltimore Street detector is out of service
 - Einer provided the timing data; no timing sheet exists.
 - The signals along Mechanic Street are not coordinated and the interconnect system is incomplete or non-existent; time-based coordination using GPS units is a possibility that WR&A will explore. WR&A will also assess the potential coordination patterns with and without the exclusive ped phase.
 - WR&A will develop several conceptual signal improvement options, with estimated costs for each. Since the City would use bond funds to fund the improvements, accessible pedestrian signals (APS) will not be required. The City wants the cost of making the complete set of improvements, not partial improvements.
 - Trucks often do not extend green interval when they move too slowly from the stop line, creating more congestion for all traffic.
 - A previous study showed level of service can be improved with a roundabout, but not with a signal.
 - Issue #4: Baltimore Street at Canal Street
 - Einer suggested making Canal Street one-way northbound to address the problem of westbound backups that disrupt the intersection of Baltimore/Mechanic. Vehicles destined for the Times-News could use Harrison Street to get there, but would have to travel on private property for part of the trip. In lieu of creating a one-way street, Jeremy suggested prohibiting left turns from Baltimore Street. John Chapman thought that this turn prohibition may be difficult to sign and enforce.
 - The parking lot with entry gate on the north side of Baltimore Street could also be a source of backups.
 - In the study of Baltimore/Mechanic signal improvement options, WR&A will assess the feasibility of adding near side indications at the railroad tracks and/or queue detection in

the block east of the tracks to reduce blockages of the Canal Street intersection that contribute to the westbound queuing problems.

- Issue #5: Baltimore Street at Washington Street/Cumberland Street/Greene Street
 - Check MUTCD for 3-way stop-controlled intersections; develop plan with options.
 - City has a contract or is on board to repave street.
 - If Cumberland Street were to operate one-way northbound (one option proposed), trucks may not be able to negotiate turns at Algonquin, and ambulances may not be able to make turns.
- Issue #6: MD 51 at Queen City Drive/Mechanic Street/Centre Street/Winston Street/I-68 Ramps
 - Most accidents may be ice-related.
 - Install “STOP ahead” sign on ramp?
 - SHA is forcing restaurant to do traffic study.
 - No detection for MD 51 and Mechanic Street approaches; operation as fully-actuated signal would reduce queuing.
 - Increasing green time from 34 seconds would reduce queuing.
 - Centre Street at Queen City Drive is currently operating under 4-way stop control.
- There may be latent demand to use Mechanic Street – need to account for growth by a percentage.
- Issue #7: SHA has signing ideas that coupled with improvements at MD 51 at Queen City Drive/Mechanic Street/Centre Street/Winston Street/I-68 Ramps may alleviate this issue.
- Issue #8: MD 51 at Lamont Street
 - Accidents are severe due to high speed along MD 51.
 - Consider relocating southbound left turn to a u-turn.
 - This issue will be left for SHA to resolve since MD 51 is SHA owned.
- Issue #9: MD 51 at Virginia Avenue
 - Improvement options were studied for this intersection, including implementing “Michigan Lefts”. The resulting re-directed left turns include: truck turns are problematic on Springdale Street – short storage, possible sight distance problem, on-street parking.
 - Quebec Avenue at Industrial Boulevard has a Michigan Left.
 - Is 2nd Street/Cedar Street possible alternatives to Springdale Street?
- Issue #10: McMullen Bridge – signed as “TO US 220”; re-sign as Bedford Street. The truck turning issue reported at Frederick and Decatur Streets will be added to this issue.
- Results to be posted on the internet.

The above is a memorandum of understanding between the parties regarding the topics discussed and the decisions reached. Any participants desiring to add to, or otherwise amend the minutes, are requested to put their comments in writing to the writer within seven (7) days; otherwise, the minutes will stand as written.

b:(472,56)

c:(443,54)

d:(420,54)

WARRANT MET: **NO**

NOTE: 115 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 80 vph applies as the lower threshold volume for minor street approach with one lane

WARRANT 2 - FOUR HOUR VEHICULAR VOLUME

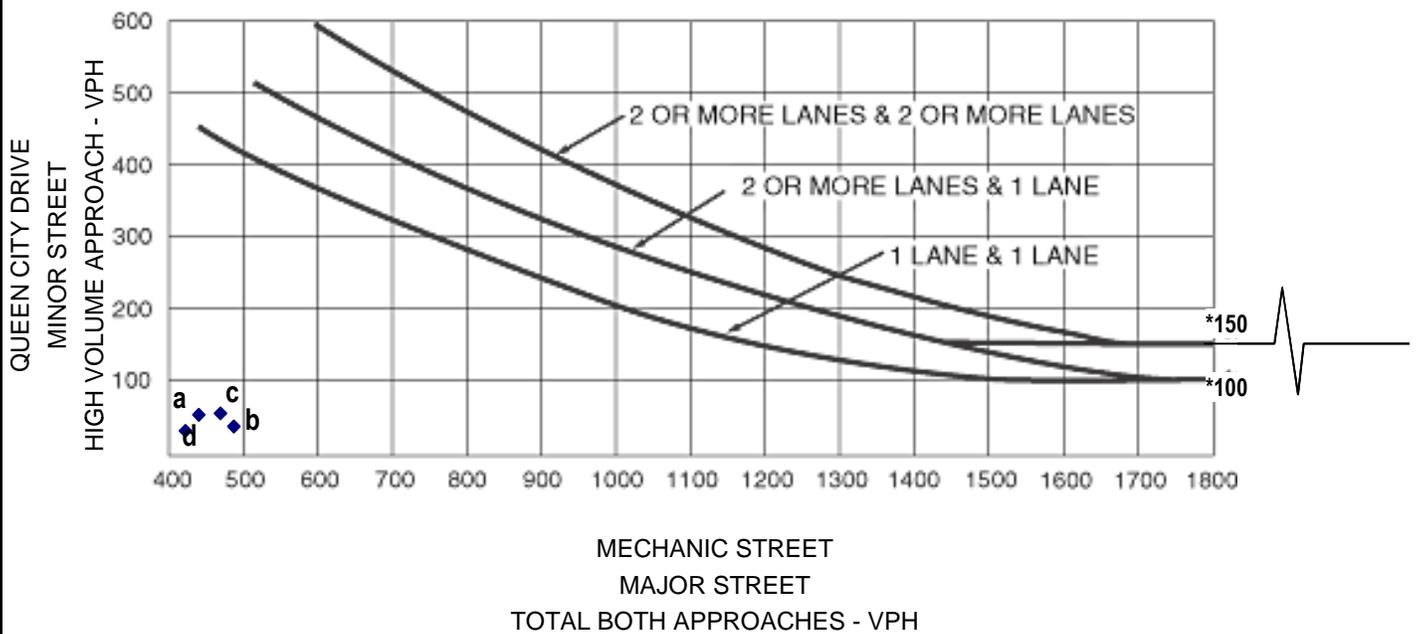

PEAK HOUR VOLUME WARRANT

a:(443,54)

b:(490,38)

c:(425,32)

d:(472,56)

WARRANT MET: **NO**

NOTE: 150 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 100 vph applies as the lower threshold volume for minor street approach with one lane

WARRANT 3 - PEAK HOUR

SIGNAL WARRANT ANALYSIS SUMMARY

WARRANT	CRITERIA			NO. OF HOURS OR CRITERIA OBSERVED	WARRANT SATISFIED
	Major Street Volume (VPH)	Minor-street Volume (VPH)	Number of Hours Required		
1A – Minimum Vehicular Volume	500	150	8	0 hours	NO
1B – Interruption of Continuous Traffic	750	75	8	0 hours	
1C – Combination Warrant 80% of Warrants 1A & 1B (56% of Warrants #1A & 1B)	400 600	120 60	8	0 hours	
2 – Four-Hour Warrant	(See Appendix for charts)		4	0 hours	NO
3A – Peak-Hour Delay Warrant	Total Delay > 4 Veh-hours Approach Volume ≥ 100 VPH Total Entering Volume ≥ 800 VPH		1	N/A N/A	NO
3B – Peak-Hour Volume Warrant	(See Figure 4C-1 and 4C-2)		1	443 vph (AM) 425 vph (PM) 54 vph (AM) 32 vph (PM)	
4 – Pedestrian Volume	100 or more pedestrians for any 4 hours <u>OR</u> 190 or more pedestrians during any 1 hour <u>AND</u> Fewer than 60 gaps/hour of adequate length for pedestrians to cross during same period observed above.			N/A	N/A
5 – School Crossing	Intersection is not used as crossing for school children.			N/A	N/A
6 – Coordinated Signal System	In order to maintain proper grouping of vehicles Within a signal system.			N/A	N/A
7 – Crash Experience	Five or more reported crashes, of types susceptible to correction by a traffic signal, have occurred in a 12-month period. Also, 80% of either Warrant #1 or Warrant #2 is satisfied.			80% of either warrant #1 or warrant #2 not satisfied	NO
8 – Roadway Network	Intersection of two major roadways.			NO	NO

SIGNAL WARRANTED (8 HRS OR MORE MAJOR & MINOR SATISFIED)															NO						

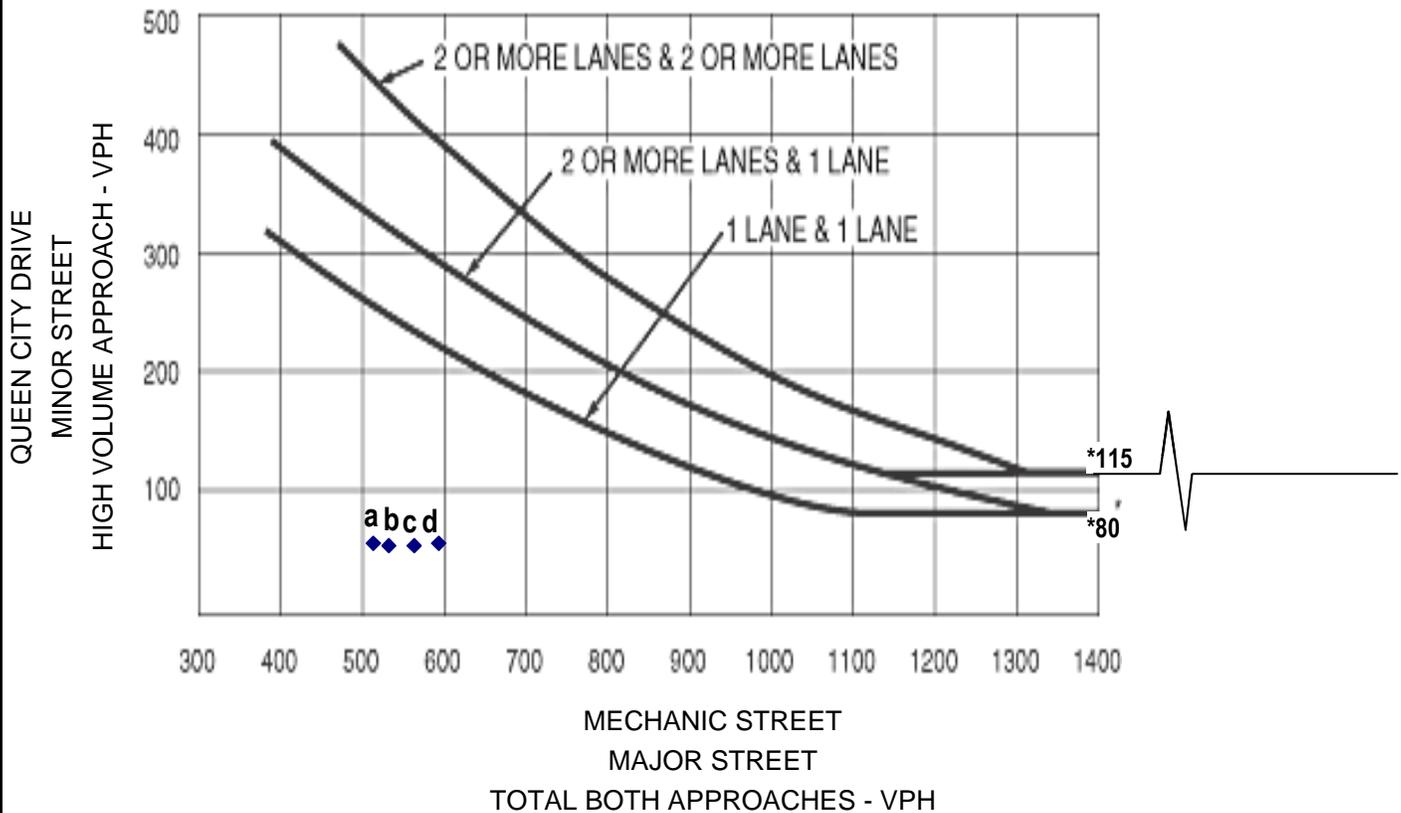

FOUR HOUR VOLUME WARRANT

a:(516,56)

b:(596,56)

c:(566,54)

d:(535,54)

WARRANT MET: **NO**

NOTE: 115 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 80 vph applies as the lower threshold volume for minor street approach with one lane

WARRANT 2 - FOUR HOUR VEHICULAR VOLUME

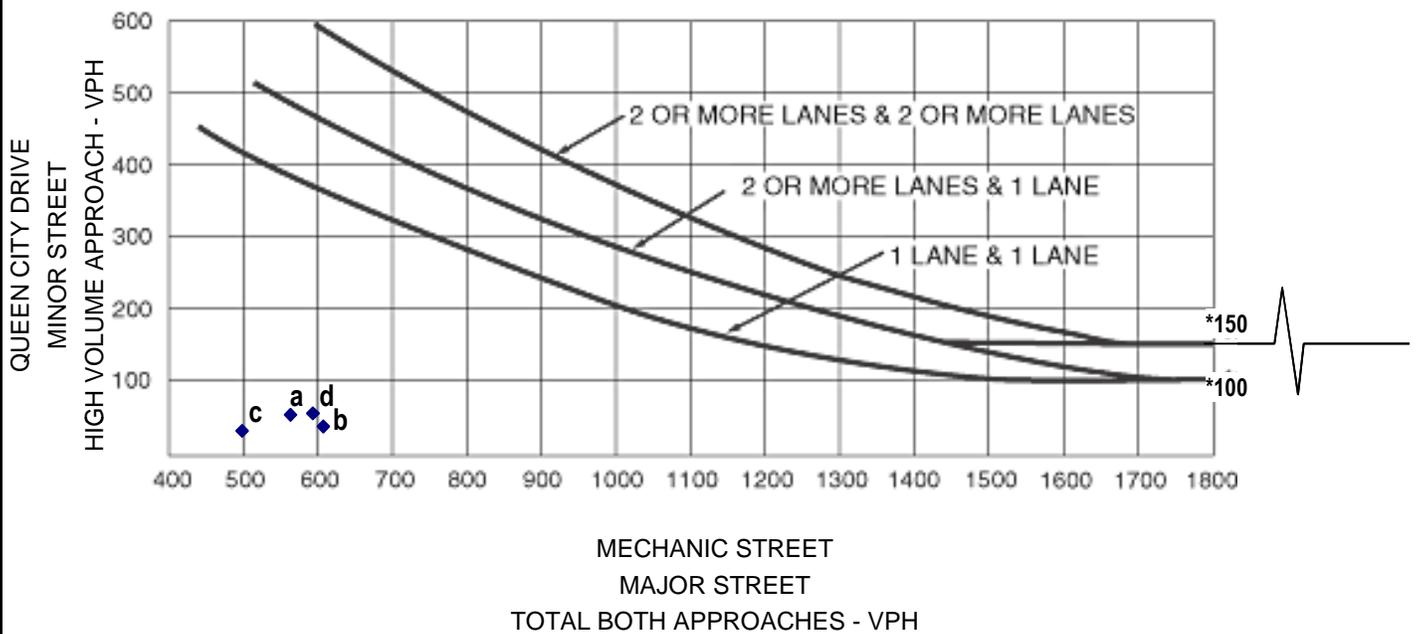

PEAK HOUR VOLUME WARRANT

a:(566,54)

b:(610,38)

c:(501,32)

d:(596,56)

WARRANT MET: **NO**

NOTE: 150 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 100 vph applies as the lower threshold volume for minor street approach with one lane

WARRANT 3 - PEAK HOUR

SIGNAL WARRANT ANALYSIS SUMMARY

WARRANT	CRITERIA			NO. OF HOURS OR CRITERIA OBSERVED	WARRANT SATISFIED
	Major Street Volume (VPH)	Minor-street Volume (VPH)	Number of Hours Required		
1A – Minimum Vehicular Volume	500	150	8	0 hours	NO
1B – Interruption of Continuous Traffic	750	75	8	0 hours	
1C – Combination Warrant 80% of Warrants 1A & 1B (56% of Warrants #1A & 1B)	400 600	120 60	8	0 hours	
2 – Four-Hour Warrant	(See Appendix for charts)		4	0 hours	NO
3A – Peak-Hour Delay Warrant	Total Delay > 4 Veh-hours Approach Volume ≥ 100 VPH Total Entering Volume ≥ 800 VPH		1	N/A N/A	NO
3B – Peak-Hour Volume Warrant	(See Figure 4C-1 and 4C-2)		1	566 vph (AM) 501 vph (PM) 54 vph (AM) 32 vph (PM)	
4 – Pedestrian Volume	100 or more pedestrians for any 4 hours <u>OR</u> 190 or more pedestrians during any 1 hour <u>AND</u> Fewer than 60 gaps/hour of adequate length for pedestrians to cross during same period observed above.			N/A	N/A
5 – School Crossing	Intersection is not used as crossing for school children.			N/A	N/A
6 – Coordinated Signal System	In order to maintain proper grouping of vehicles Within a signal system.			N/A	N/A
7 – Crash Experience	Five or more reported crashes, of types susceptible to correction by a traffic signal, have occurred in a 12-month period. Also, 80% of either Warrant #1 or Warrant #2 is satisfied.			80% of either warrant #1 or warrant #2 not satisfied	NO
8 – Roadway Network	Intersection of two major roadways.			NO	NO
